Topic: 964 Message: 992

William that overloading normally occurs when the
repeater is a GE. :))))

BIG laugh John..

I really have never experienced problems with
overloading one of the Motorola's. We used only
Maxtrac and Radius mobile models. At one site on a
mountain where one of the neighbors was a ham repeater
on 147.12, we installed our antenna 15' down the tower
so that the GE would not be desensed. They had added
a preamp to the GE and that caused it some good
intermod as it was.. which caused the repeater to
hangup before we were ever there and so we went in
knowing that if we were not careful there could be a
problem with the GE. The old timers in the club did
not want a PL tone added to the repeater, they felt it
was better to just let the repeater hangup and timeout
repeataly. Is that called air pollution or intentional
interference??? :)) No, PL tones won't prevent or
help desense when the frontend is as wide as a
barndoor. We were running 40 watts and the GE was
running 100 but it never affected our Motorola. We
always tried to be good neighbors and accomodate for
any GE equipment being used in the same location..

From: Ben Sager
Topic: 964 Message: 993

I don't remember the exact answer to your question but
I will find out. However, I don't remember such poor
sensitivity figures from anything other than the older
GE's and much older Motorola's. The GE's were
received from the VA State Police as they were being
replaced. I took one for a Army MARS node on 148.65
and regretted it from day one.. Henry retuned it
monthly. Speaking of VSP, do you know Henry Hassell??
He was a radio tech for them and use to ask the same
questions whenever Motorola came up in our meetings.
Now, I am wondering if that is learned in GE tech
school??? :)))) Just kidding John. I understand
brand loyality.

994. Ten-Tec Object

Yahoo group: EastTNAPRS
Date: 2005-12-07 01:49:30 UTC
From: William McKeehan
Topic: 994 Message: 994

I was looking at my path from today and I noticed one little thing. The Ten-Tec object is not at the correct location.

The correct location is:
3551.78N
08331.78W

996. UX-4 2nd attempt scheduled for 12/10/05

Yahoo group: EastTNAPRS
Date: 2005-12-07 04:47:58 UTC
From: Greg Williams
Topic: 996 Message: 996

Due to equipment problems and unpleasant weather conditions for testing, it was decided to postpone the launch of the University of Tennessee Amateur Radio Club (UTARC) balloon flight UX-4 until the following weekend.

This Saturday, December 10, 2005, the weather appears to be cooperating for this test run of the 20m beacon. All equipment was tested during pre-flight clearance and are ready to go.

Launchtime is slated for 10AM Eastern Time (1500 UTC).

This mission contains only a 20 meter CW beacon with battery voltage and transmission number being transmitted via the beacon. The power out is about 1 1/4 watt depending on antenna ERP. The frequency is 14.328 MHz CW but tune up or down as temperature changes during the flight may cause the transmitter to drift. The Balloon Callsign will be AA4UT/B.

Success of this mission is reliant on the signal reports we get back from listeners. The 20m CW transmitter is being tested for use on future missions that will relay telemetry readings as well as produce reception reports from earth stations on HF bands. Recovery operations are not planned for this flight as only the 20m beacon and battery are onboard. It will have a homemade parachute and ID tags on the payload in case it is recovered in a populated area.

This beacon, if successful, will be used on balloon flight UX-5, now scheduled for the weekend of December 17 (the following Saturday) to deliver expanded telemetry readings about the payload as we attempt a reception distance record. More information on that flight and its payload will be made available soon.

UTARC will spot the transmitter on DXclusters and there will be QSL info in the beacon ID. If you would like to email your report, please send an email to info@... <mailto:info@...> with your Callsign, QTH, and signal report.

These were the coordinates that they gave me when they asked me to
set up an object for them. I'll verify it with a GPS the next time
I'm up there.

998. Re: [EastTNAPRS] Ten-Tec Object

Yahoo group: EastTNAPRS
Date: 2005-12-07 14:04:47 UTC
From: William McKeehan
Topic: 994 Message: 998

The reason that I noticed it was that I was parked across the road at the high-school yesterday.

When I was looking at my track I noticed that my position was not shown as being right across the road from Ten-Tec. I turned on the satellite images and confirmed that the location my GPS had was acurate and used the images to locate the Ten-Tec front door.

Let me know when you confirm it's location by a visit with a GPS...THANKS!

999. Re: [EastTNAPRS] WA4KJH-7

Yahoo group: EastTNAPRS
Date: 2005-12-07 16:06:35 UTC
From: John Moyers
Topic: 964 Message: 999

I've over looked part of this message with all that has been going on this week. Ben makes a point down in here while he is needling me a little about brand names, and ham repeaters may be some of the worst violators of some basic rules of radio engineering practices.

The key point in Ben's digi not having problems with the repeater and the repeater not having much from the digi was first and for most antenna placement. In VHF our rule of thumb is 20' vertical separation or if they are in the same basic horizontal plane you need 40' of horizontal separation. This will give you minimum desense as a general rule of thumb. IF, the operational frequencies of both radios have enough frequency separation (say a couple of MHz) then you can sometimes fudge the separation distance a little without any obvious problems.

The violation I was speaking of above is in the use of receiver preamps. Most of the Motorola Micor and GE Master II receivers that are used as ham repeaters have what some believe are less than optimum sensitivity. When compared to the modern receivers in current commercial and public safety use today they were. A Motorola Quantar repeater will normally have a receiver sensitivity of 0.19 uV @ -12db Sinad where these older vintage receivers will run about 0.32 to 0.40 uV for the same level of sensitivity. If you look in the Micor manuals the sensitivity spec was 0.50uV @ -20db Sinad. Keep in mind that -20bd Sinad is roughly full quieting. To over come this, some of the Hams that have bought these older radio's as surplus and converted them to the ham bands have installed 20db or greater preamps in front of the receivers to improve the repeaters coverage area. This is the problem. Part of the receiver's signal rejection ability relied on the lower sensitivity of the receiver to do it's job with the filtering technology available at the time of design.

The preamps do their jobs quite well and the repeaters receive sens is increased dramatically. So is it's susceptibility to adjacent channel and in-band interference. Some of this interference can be corrected by using Crystal filters that will only allow signals to pass that are very close to the repeaters assigned frequency. These XTAL-Filters are placed between the cavities and the receiver preamp. The interference problem that Ben mentioned I have seen in Motorola and GE repeaters of the same vintage and all have been caused by the same problem. To much preamp and not enough filtering. Then add to that, antenna's that are to close together on an already overloaded tower or because everyone wants to be at the top of the tower, and interference is what you will get. I have actually heard these repeaters interfere with themselves when all they are doing is transmitting their station idle ID's. The bad problem is, most of us know better than to do things the way we do them at times. It all comes down to trying to support a hobby and a family with limited $$$$. Xtal-filters are not cheap, cavities are not cheap, high quality antenna's and feedline are REALLY not cheap and brand new high quality repeaters a just plain EXPENSIVE for use as a hobby repeater..... (Think THOUSANDS of $$$$$$$ for a new P25 Quantar.)

Subject: RE: [EastTNAPRS] WA4KJH-7

William that overloading normally occurs when the
repeater is a GE. :))))

BIG laugh John..

I really have never experienced problems with
overloading one of the Motorola's. We used only
Maxtrac and Radius mobile models. At one site on a
mountain where one of the neighbors was a ham repeater
on 147.12, we installed our antenna 15' down the tower
so that the GE would not be desensed. They had added
a preamp to the GE and that caused it some good
intermod as it was.. which caused the repeater to
hangup before we were ever there and so we went in
knowing that if we were not careful there could be a
problem with the GE. The old timers in the club did
not want a PL tone added to the repeater, they felt it
was better to just let the repeater hangup and timeout
repeataly. Is that called air pollution or intentional
interference??? :)) No, PL tones won't prevent or
help desense when the frontend is as wide as a
barndoor. We were running 40 watts and the GE was
running 100 but it never affected our Motorola. We
always tried to be good neighbors and accomodate for
any GE equipment being used in the same location..

1000. Re: [EastTNAPRS] WA4KJH-7 #14

Yahoo group: EastTNAPRS
Date: 2005-12-07 21:12:19 UTC
From: Ben Sager
Topic: 964 Message: 1000

Gentlemen, I have a very good Elmer, who was a retired engineer, and he has never gotten tired of answering my questions. He is 84 now and still answers my questions.. He offered lots of good common sense advice to on such things as antenna placement, coax, etc., and to not to use not use the older cavities that became detuned as easily as the old GE frontends that John was talking about if someone sneezed in the room. He didn't like preamps either on the older radios, so he steered me away from them. He (wc4tt) provided us with a tuned 1/4 wavelenght stub to suck out a specific interferring freq if needed at a site.. BTW, the ARRL handbook no longer has that stub in it (or so I was told) and it worked great back in the early days when we started with a Micor and that darn Master II doing packet at the same site. PLUS it was FREE!!! Both had a tuned 1/4 wave stub to ground on the other transmitter's freq.... It worked so well!!!! What I am saying is that there are workarounds. John is very correct that it can get expensive, as my wife will testify, even if you don't try to go the commerical route with newer equipment and if you have to buy everything!!! I can't believe the prices of TNC's today for example. Thank god for MFJ.. :))

I appreciate John's help and his situation. More people like him are needed to make networks perform as planned. We never know when that network may be needed very badly!!!! I can verify that being the person making site visits sure got old after a couple years but I knew I had to do it because most users would rather just complain if something went wrong that go check on it. But I learned some tricks to make things easier for me, such as I used my IFR to check freqs and deviations on all our nodes monthly, normally late on Saturday or Sunday nights, from home using a beam... This helped me a lot, since I didn't have to run to the towers to do it... It was one of those ideas that no one had tried until I tried it and found it worked great. I then knew what the transmitters were doing and didn't have to run to the sites "just" to test. Deviation was set at no more that 3.0khz. I was "gifted" with a Motorola rib-box and their wide open software which allowed me the flexibility of tuning the Motorola radios wherever.

But twice a year I went to the sites to make sure all
was up to snuff. As I said, we never had a complain
from our neighbors nor had the network not functioning
as we promised for ECOM situations.. I became
familiar with the Motorola's and became a fan. I know
that GE also has some good radios as well.

Anyhow, enough of my ramblings.. I have enough
experience to be dangerous.. :))))

Everybody have a great Christmas!! And thank all of
you trying to be a helping hand!!

1001. BACK ON MY SOAPBOX AGAIN

Yahoo group: EastTNAPRS
Date: 2005-12-08 00:37:04 UTC
From: Kevin R. Colvin
Topic: 1001 Message: 1001

I AM NOT BASHING ANYONE, JUST TRYING TO MAKE A POINT, , , BUT. . . TWO OPERATORS, CHATTING BACK AND FORTH THRU A DIGI, AND GET IGATED TO TIMBUCKTOO AND SOMETIMES DIGI'D THRU WHO SENT THE MSG, AND OTHER TIMES DIGI'D THRU WHO'S RECEVING IT...

I JUST FAIL TO SEE WHERE THAT IS PROVIDEING A SERVICE.

HERE ARE ONLY A FEW SELECTED LINES FROM THE MESSAGES PASSED, SO THERE IS NO REAL WAY TO SORT THRU AND SEE WHAT IS GOING WRONG.

BUT, MY POINT IS, TOO MANY HOPS CAUSED BY AN I-GATE ! ! !

YEAH, BUT, MY DEFAULT PATH IS WIDE2-2, NOT RELAY WIDE WIDE3-3 OR SOMETHING CLOSE TO THAT. AND THE OTHER PERSON'S DEFAULT PATH (TO THE BEST OF MY KNOWDLEGE) IS JUST THE THE CALL SIGN OF THE DIGI HE USES. HE MIGHT HAVE ONE WIDE BEHIND IT, BUT THAT'S STILL ONLY 2 HOPS. . .

I GUESS I NEED TO STOP SENDING MESSAGES, BUT THEN IF I DID THAT, WE WOULDN'T NEED I-GATES FOR ANYTHING BUT MAKING SURE WE SHOW UP ON FINDU.COM. . .

SO COME ON GUYS AND GALS, I HAVE SAID THIS ALREADY AND I'LL SAY IT AGAIN, LIMIT YOUR HOPS, AND THAT INCLUDES I-GATES SETTINGS TOO. NO WONDER WA4KJH-7 CAN'T HEAR. . . AS MUCH PING-PONGING AROUND AS LOCAL TRAFFIC GETS.

OK. . . I'M OFF MY SOAPBOX NOW. . . AND MY E-MAIL ADDRESS IN QRZ IS CORRECT TOO. . .

1002. E-Mail

Yahoo group: EastTNAPRS
Date: 2005-12-08 01:13:56 UTC
From: ka4tar@charter.net
Topic: 1002 Message: 1002

I noticed last week that when someone posts a message on the APRS group site. The e-mail get repeated over and over again by who ever replys to it. They include the posted e-mail with their reply. I had 14 messages last week with the same post.
Is there anyway to just get the post and only the replys that i want to read? instead of the whole can of spam.

73, From Darrell Sperry, KA4TAR, OES

In the sample data that you provided, I don't see the issue that you are seeing. Can you explain what you are seeing? Maybe by giving an example or two?

This is 100% determined by how the person composing the response.
For people who get a daily digest message, having the history there is anoying; for someone like myself who reads each response directly, the history is often helpful in remembering what the message was about.

I try to do something like what I have done below - I edit the original message to only include the important parts.

As with many things on the internet, this is a personal preference and often degrades into "religious" wars - even top posting (like i have done) or mixing the post in with the original message is debated.

I would ask everyone to consider that a number of the people who participate in this discussion group do not have high-speed internet conections; every byte of data is more time they have to spend on-line (the same is true for high-speed connections, it's just less noticable to the users). So think about the "extra" data in your post and only post what is necessary.

From: Scott
Topic: 1002 Message: 1005

In my preferences of my membership to the group, I chose "No email - I'll read messages on the web site." I get about 50-60 emails a day anyway and it is easier for me to view them once or twice daily at the site by logging in. I usually do it right after I check my Yahoo emails.

Topic: 1001 Message: 1006

I think Kevin may be refering to this:

KF4YMC-1>APU25N,TCPIP,WA4RYW-1,KF4YMC-1,W4LAW-3,WIDE3-1*

If you will notice after Kevin's original transmission (KF4YMC-1>APU25N), after it comes back through the I-Gate, there are 5 additional hops (WA4RYW-1,KF4YMC-1,W4LAW-3,WIDE3-1). That means someone is set at WIDE5-5 or WIDE,WIDE,WIDE,WIDE,WIDE. I have noticed this too, and have even set my message path to RFONLY and it still got picked up by the I-Gate. And that is even setting my rig to 5 watts.

I agree with Bob in the message below. In partial response to this, I have added a command to my digi-ned (KI4HDU-2) setup. The command is ?VHF. Right now, it responds with two messages, one that says 146.94- and one that says 146.85-.

What other repeaters would be good to recommend to travelers? Is there any additional information that I should tell them? Should I put this information in an object instead of a message to give the traveler an idea of where the repeater is located (if so, does anyone have the locations of these repeaters)?

I've thought about the same thing with UHF, but am not sure which repeaters I should list there. Any ideas?

---------- Original Message ----------
Subject: [aprssig] Voice Repeater Posits...

To: aprssig@...

This is why we need a beacon in many digis with
an object for the local preferrred traveler repeaters
sent DIRECT (to minimize network load, but to
inform travelers. Remember, APRS is supposed to
be your resource showing you everything live
around you...

> I also wish that there was a method of overlaying the
> VHF/UHF repeater coverage prediction charts over the
> GPS moving map display... for the whole route TX-VA!
> Otherwise I'm going to be going loopy fingering through
> the ARRL repeater directory!

Also, local ECHOlink, IRLP and Winlink nodes should
also appear on the front panel of your D7 or D700 radio.

From: William McKeehan
Topic: 1001 Message: 1009

My first question would be why is KF4YMC-1 repeating his own packet?

Other than that, I suspect that WA4RYW-1 is putting this packet out on RF with a path of WIDE3-3 (which puts it thru KF4YMC1, W4LAW-3, then a 3rd that is not configured to use alias substitution).

So WA4RYW-1, can you confirm your settings to the group? What path does your IGate gate packets to RF via?

As for your packets with RFONLY set getting picked up by an IGate...Do you know which IGate picked it up? And by picked up, what exactly do you mean? Placed on findu or something else?

1010. RE: [EastTNAPRS] WA4KJH-7 #14

Yahoo group: EastTNAPRS
Date: 2005-12-08 14:04:22 UTC
From: John Moyers
Topic: 964 Message: 1010

Ben, I had forgotten about the stubs.... They are still in use in the industry and work great if you know the specific frequency giving you a problem. A lot of times we don't, so we settle for quick and easy, and just use an Xtal-filter.... That said, I used to have a 6 cavity duplexer that we had taken out of service with 12 tuning stubs on it to filter out a commercial broadcast station. I just recently saw a brand new duplexer put into service that had stubs as well. Like you, I have heard that the newer handbooks have removed tuned stubs for filters, so guys if you find any of the older handbooks hang on to them..... The league can not put everything into a handbook, as new things come along some of the older things are removed. Newer isn't always better, but we don't want a handbook we have to haul around in it's own trailer either.

Ben also sounds like me, we owe a lot to our elmers from years ago. Many of mine are now SK, a few more are around and retired so I like to pick their brains when I get a chance and find something that I need a quick fix for. This part of the craft from Ham Radio is going away as we start buying our gear new and do less and less modification of older gear or even better, building our own gear. Designing, building, modifying, and repairing our own gear is about 80% of the fun I have had in ham radio over the last 33 years. I can't tell you how many times what I have learned has paid off in disasters.

I have enjoyed this thread, and your correct the GE Master II front ends were a pain at times. The Motorola's of that era had their own set of quirks and unfortunately I have had to work on all of them. The only nice thing I liked better about the GE's was that the front end was its only main quirk and it was mostly with VHF High Band radio's The UHF's didn't seem to be as bad. So I knew if the complaint was poor reception all I had to do was hook up the service monitor and wiggle the tuning lugs back and forth a view times, peak the filter back up to specs and the service call was done. A miracle repair for 10 minutes of work. Can't say that I've ever corrected anything on a Motorola that quickly, of course if you would just leave them alone they would work forever with very few problems.

1012. new Traders Net Tonight

Yahoo group: EastTNAPRS
Date: 2005-12-08 14:57:14 UTC
From: William McKeehan
Topic: 1012 Message: 1012

I've been scanning around this week and came across a discussion on 147.195+ (100Hz tone). They (Scott, KD4CWB, et.al.) are planning to have a traders net starting tonight. It's a new concept - doing some auction style stuff.

It sounds like they are going to take an interesting approach. For starters, all check-ins will get their name put in a hat for a drawing for a new 12volt, 5Ah battery.

This is their first week...

I think they are going to try to do it every Thursday. I did not stay for the entire net last night, so I did not hear all of the announcements.

I can tell you they had a large number of people on the net last night. I guess giving away free stuff is a good way to get participation :-)

1019. Morristown NWS APRS Machine

Yahoo group: EastTNAPRS
Date: 2005-12-13 17:01:06 UTC
From: ke4cqw
Topic: 1019 Message: 1019

Hi all,

I don't normally pass stuff like this around but in this case I am going too. We have a very urgent need to replace the APRS computer and monitor at the National Weather Service office in Morristown.

I was at the NWS during the national Skywarn recognition day to help with the event and to upgrade the UI-View program to use the Precision Mapping program to help the net controllers see us and have a alternative way of feeding them information so that they are tied up with something important we are not interrupting them with lower priority traffic.

If some one has a machine that they are not using and could donate that would be great we need something that is relatively fast (700mz + with at least 256 or better ram). The hard drive size does not matter, 10 gigabyte will work. But it does need a better than average video card we really need a 32 meg or better video card to run the mapping software program with out slowing the machine down too. I know this system will work because that what I am running at the moment at home it's slow at times but it does the job. The only item that is over the top is I think they need a larger flat screen monitor to use. The current monitor is a 15 inch that needs to be replaced but the shelving around it and weight are a concern but a bigger monitor would help.... hench the idea of a flat screen.

If you don't have a machine I will take donations to help buy a new machine or new monitor if someone has a machine they are not using . Any extra money collected will go to upgrade the machine to up the performance. I can be reached at moebrewer@... or my cell at 865-621-9317 if you have any questions or have equipment I will travel to get what ever you have.

I have attached Ed's note below:

"Hi Moe

Please pass on to whoever you think ought to see this

I did go get the computer and took it to my nephew,
He said it's old that I could buy a new one for the same price it would take to replace all the stuff inside the old one. The processor, power supply, mother board are not usable.

He gave me the choice:

He could help me go up on the Internet and do some window shopping or go to Walmart, they have some that beat this existing one. But to use the APRS system we need a different computer.

I put the computer back on line but don't have enough savvy to get the program back on line as you had it. So it will not appear on the map.

I'm at the weather station this afternoon to see if they will volunteer any funds at all. We will see if they have anything we could use.

It would be nice if we could have the stuff up and running by the Morristown ham fest time so we could give a bit of warning toward our next SKYWARN meeting.

See you on the telephone ASAP.

73's Ed W4VGI"

Thanks for your time and Merry Christmas, Moe N4CQW

1020. Re: [EastTNAPRS] Morristown NWS APRS Machine

Yahoo group: EastTNAPRS

From: Jeff Yawn
Topic: 1019 Message: 1020

Moe,
I have recently come into possession of a VERY NICE dual monitor video card that would be perfect for this use. I do not have a computer that will fit the bill but I have many parts if someone else maybe has computer that we could upgrade I probably have enough junk lying around to finish it up. The only 17 inch monitors I have are big and clunky (not flat screen).

Anyway I'll donate what ever I have that will fit the parameters.

My home IGate continues to have a hard time being heard by WA4KJH-7. I think it is temperature related because it seems like I can be heard better in the afternoon and less overnight.

From: William McKeehan
Topic: 964 Message: 1024

Taking some time this morning to look at my setup, I found that I have a problem with the soundcard interface on the box that I had setup as my IGate.

For now, I have changed that box to use my D700 and am using the soundcard interface with my laptop. My laptop can be heard by WA4KJH-7 with the HT on low power or about 0.5 watt.

So there is no problem with KJH-7, but a problem with my station.

Topic: 1025 Message: 1025

Does anyone else on this list hear beacons from KA4TAR? I'd like to see some sample data if you could snip some from a log file.

Thanks!

1029. What makes a good digi?

Yahoo group: EastTNAPRS
Date: 2005-12-22 01:32:39 UTC
From: William McKeehan
Topic: 1029 Message: 1029

I'm working on a document that I would like to get your input on. I would like to be able to help new APRS stations determine if their location is a good location for a digi along with a consistant explaination of why it is or is not a good location.

Here's what I have so far. I look forward to comments.

There are 2 types of digi: fill-in and wide area.

The wide area digi's provide the backbone of the RF network. Working much like a voice repeater, they relay traffic between stations that would not normally be able to hear each other.

To be a wide area digi, the first thing that is necessary is to have a wide coverage area. HAAT, in particular, is a primary factor between a wide area digi and a fill-in digi. Wide area digi's are generally positioned on the top of hills that overlook a wide area. As a general rule of thumb, if the station will not be over 100 feet HAAT then it should not be a wide area digi.

The next thing to consider when putting up a wide area digi is the location of the nearest existing wide area digis. If a moderately equipped mobile station can hear and talk to the nearest wide area digi, then a wide area digi may not be needed at this location.

If the station can only hear and talk to one wide area digi, it may not be in a good location to be a wide area digi. The wide area digis need to form a network and need to be able to pass traffic from one area to another.

If the station can only hear multiple wide area digis that can already communicate, then it may not be a good location to be a wide area digi. Too many wide area digi's in a given area can create unnecessary packets thus reducing the local RF bandwidth.

In all of the above situations where the station may not be in a good location for a wide area digi, it may be a great location for a fill-in digi.

Fill-in digi's are generally home stations that can reliabily reach one or more wide area digi's.

If a low power station in the area that a fill-in digi can hear can also be easily heard directly by a wide are digi, then the fill-in is not needed.

Mobile or low power stations can use these fill-in digi's to reach a wide area digi.

From: Scott
Topic: 1019 Message: 1030

Just a couple of comments on MEX and a wide digi up there:

Glad to see it happening. One thing I did at KF4CFO-7 was to set the computer so that it would auto re-boot if power failed, or the computer shut down, and also put the exe for UI-VIEW in the Start up file.

Also, And I hope this has already been done, but be sure to ask Howard Waldron for permission to use the WX4MRX callsign for the wide digi. He is the trustee for it, adn he is the one ultimately responsible for proper operation.

Keep up the good work!

Scott NA4IT

Oh yea, HAVE A MERRY CHRISTMAS! I won't have APRS on board, but I will be on 3.980LSB Friday as I go to Louisville KY for Christmas. Leaving McMinn CO around 9:00AM.

73!

Dear UTARCers,

The balloon flight scheduled for Dec 26 has been postponed
indefinitely. Instead, there will be another "disposable" launch on Dec 31.
This one will carry GPS and have a twist, however. Stay tuned for more
info!

73,
Mike

1033. MRX APRS Station will be back on the air

Yahoo group: EastTNAPRS
Date: 2005-12-22 16:56:17 UTC
From: ke4cqw
Topic: 1033 Message: 1033

Hi all,

I have the new WX4MRX computer in hand and up operating from my house at the moment. Please if you have APRS send it a message, it will reply back with an automated message. I just want to function check everything before I take up to Morristown tonight.

Thanks to all that offered help with either money or parts to use in upgrading the machine.

73, Moe N4CQW

1034. Re: MRX APRS Station will be back on the air

Date: 2005-12-23 00:50:36 UTC
From: Scott
Topic: 1033 Message: 1034

Sounds good Moe. What I had envisioned is them using APRS for us to send them objects denoting where actual severe WX is happening. That's just my take though. Others probably have much better ideas than me.

1035. CWIDing on 144.390. ???????

Yahoo group: EastTNAPRS
Date: 2005-12-23 02:18:43 UTC
From: Kevin R. Colvin
Topic: 1035 Message: 1035

CWIDing on 144.390.

Is it legal you might ask ? Well that is simple to answer.

Title 47--Telecommunication / CHAPTER I--FEDERAL COMMUNICATIONS COMMISSION (CONTINUED)
PART 97--AMATEUR RADIO SERVICE / Subpart D_Technical Standards
Sec. 97.305 Authorized emission types.
(a) An amateur station may transmit a CW emission on any frequency authorized to the control operator.
VHF:
2 m 144.1-148.0 MHz..... MCW, phone, image, RTTY, data, (2), (5), (8).

And just for the record : Control operator.
An amateur operator designated by the licensee of a station to be responsible for the transmissions from that station to assure compliance with the FCC Rules.

So,Yes it is legal.

Is it required on 144.390 when operating in APRS Mode ?

TITLE 47--TELECOMMUNICATION
CHAPTER I--FEDERAL COMMUNICATIONS
COMMISSION (CONTINUED)
PART 97_AMATEUR RADIO SERVICE--Table of Contents
Subpart B_Station Operation Standards
Sec. 97.119 Station identification.
(a) Each amateur station, except a space station or telecommand station, must transmit its assigned call sign on its transmitting channel at the end of each communication, and at least every 10 minutes during a communication, for the purpose of clearly making the source of the transmissions from the station known to those receiving the transmissions. No station may transmit unidentified communications or signals, or transmit as the station call sign, any call sign not authorized to the station.
(b) The call sign must be transmitted with an emission authorized for the transmitting channel in one of the following ways:
(1) By a CW emission. When keyed by an automatic device used only for identification, the speed must not exceed 20 words per minute;
(2) By a phone emission in the English language. Use of a phonetic alphabet as an aid for correct station identification is encouraged;
(3) By a RTTY emission using a specified digital code when all or part of the communications are transmitted by a RTTY or data emission;
(4) By an image emission conforming to the applicable transmission standards, either color or monochrome, of Sec. 73.682(a) of the FCC Rules when all or part of the communications are transmitted in the same image emission
(c) One or more indicators may be included with the call sign. Each indicator must be separated from the call sign by the slant mark (/) or by any suitable word that denotes the slant mark. If an indicator is self-assigned, it must be included before, after, or both

before and after, the call sign. No self-assigned indicator may conflict with any other indicator specified by the FCC Rules or with any prefix assigned to another country.
(d) When transmitting in conjunction with an event of special significance, a station may substitute for its assigned call sign a special event call sign as shown for that station for that period of time on the common data base coordinated, maintained and disseminated by the special event call sign data base coordinators. Additionally, the station must transmit its assigned call sign at least once per hour during such transmissions.

[[Page 595]]

(e) When the operator license class held by the control operator exceeds that of the station licensee, an indicator consisting of the call sign assigned to the control operator's station must be included after the call sign.
(f) When the control operator is a person who is exercising the rights and privileges authorized by Sec. 97.9(b) of this part, an indicator must be included after the call sign as follows:
(1) For a control operator who has requested a license modification from Novice Class to Technical Class: KT;
(2) For a control operator who has requested a license modification from Novice, Technician, or Technician Plus Class to General Class: AG;
(3) For a control operator who has requested a license modification from Novice, Technician, Technician Plus, General, or Advanced Class to Amateur Extra Class: AE.
(g) When the station is transmitting under the authority of Sec. 97.107 of this part, an indicator consisting of the appropriate letter-numeral designating the station location must be included before the call sign that was issued to the station by the country granting the license. For an amateur service license granted by the Government of Canada, however, the indicator must be included after the call sign. At least once during each intercommunication, the identification announcement must include the geographical location as nearly as possible by city and state, commonwealth or possession.

[54 FR 25857, June 20, 1989, as amended at 54 FR 39535, Sept. 27, 1989;
55 FR 30457, July 26, 1990; 56 FR 28, Jan. 2, 1991; 62 FR 17567, Apr.
10, 1997; 63 FR 68980, Dec. 14, 1998; 64 FR 51471, Sept. 23, 1999; 66 FR
20752, Apr. 25, 2001]

ok now lets look at this:
a) Each amateur station, except a space station or telecommand station, must transmit its assigned call sign on its transmitting channel at the end of each communication, and at least every 10 minutes during a communication, for the purpose of clearly making the source of the transmissions from the station known to those receiving the transmissions. No station may transmit unidentified communications or signals, or transmit as the station call sign, any call sign not authorized to the station.
so yes an id must be give in accordance to the above ruling. but lets look on down the column.
(b) The call sign must be transmitted with an emission authorized for the transmitting channel in one of the following ways:
3) By a RTTY emission using a specified digital code when all or part of the communications are transmitted by a RTTY or data emission;

OK, this would seem to tell me that as long as I IDed using the specified digital code for data, I would be following FCC Rules and Regs.

Lets look at the word DATA.
RTTY or data emission having designators with A, B, C, D, E, F, G, H, J or R as the first symbol; 1, 2, 7 or 9 as the second symbol; and D or W as the third symbol is authorized.

APRS falls under PACKET, PACKET falls under DATA specifications. (data emission using a digital code whose technical characteristics have been documented publicly, such as CLOVER, G-TOR, or PacTOR, for the purpose of facilitating communications.)

So all that said, I fell pretty sure that IDing with a beacon packet is all that is required to stay legal.

So using the excuse, I use it to stay legal, is not an option... furthermore... it eats up channel time - at least locally - as this is incapable of being digipeated.

so there it is, CW IDing is nothing more that local interference, unless your in CANADA:(To comply with Canadian law, every packet station in Canada must identify using morse code or voice every half hour that the station is up and running.) Or should I say, that was the last I ruling I am aware of.

And I can add this to all that. Trying to hear the code being sent when a digital packet hits it, well its not easy, but, I'm a lid. And a lot of Operators haven't learned code or forgot what the did learn. Fact, not fiction. Why do you think they are trying to do away with CW requirements for licensing.

Now if I hadn't been woke up from my afternoon nap. (yes I do monitor the audio side of APRS from time to time.) By a very loud CWIDer, I would have never been prompted tp post this. Now you know the rest of MY STORY.

Do some TNC's or radio's have this as an automatic feature? I have not seen it as an option in the D700 or in any soundcard software that I have used.

Maybe someone has it on without realizing it?

I HAVE NOT FOUND A TNC "YET" WHERE THE CW ID IS NOT A YES OR NO OPTION. IF THERE IS A TNC WHERE THIS IS AN AUTOMATIC FEATURE, PLEASE LET ME KNOW.

I HAVE TRIED AND USED SOME OTHER APRS PROGRAMS, ie: APRSDOS, WINAPRS, APRS+SA, and AGW TRACKER. ALONG WITH MY CURRENT FAVORITE, UI-VIEW. I HAVE NOT FOUND A CW ID OPTION IN ANY OF THESE PROGRAMS.

I TRUELY HOPE THAT THE CW IDing STATION HAS SET THIS OPTION BY MISTAKE. POSIBLIY NOT UNDERSTANDING THAT IT IS NOT REQUIRED, OR NOT KNOWING WHAT THE FUNCTION DOSE.

1038. RE: [EastTNAPRS] CWIDing on 144.390. ???????

Yahoo group: EastTNAPRS
Date: 2005-12-23 15:24:34 UTC
From: John Moyers
Topic: 1035 Message: 1038

To add to this, The CW ID is a hold-out from the early days of packet radio (25 - 30 years ago) when the rules hadn't fully caught up with the technology. It may also still be needed in some foreign countries, so the option has been left in the firmware. (It also makes for a cheap CW Beacon if you need one and have an old TNC laying around collecting dust.) It is set to OFF by default and if it is turned ON then it has been done intentionally.

So Kevin, you forgot a piece of the PART 97 that you were posting. That would be the regulation concerning intentional harmful interference. The CW ID does cause packets to be lost, therefore it is harmful and is interfering with the communications on the frequency. Since this parameter must be set intentionally to the ON position, the the CW ID is intentional.

Does this make the use of a CW ID on a packet data channel illegal? That depends, it definitely violates the best practices rule. But, the allegation of intentional interference also has the threshold of INTENT. If CW ID has been set to ON by someone who didn't know that the practice was causing interference then NO it is not illegal. However, once the operator has been informed that the CW ID is causing interference and that using their callsign in the data stream satisfies the ID requirement, then the interference could be considered intentional and subject to FCC Action.

This is just a reminder.

I am planning to hold the net tomorrow (Christmas) evening at the usual time; 8:00 PM. I expect to get a couple of presents from Santa that would have me in the shack playing radio anyway, so I thought I would hold the net to see if anyone else is sitting around relaxing after a wonderful day of celebration.

Join if you can and tell us all what Santa brought you!

Merry Christmas everyone!

I assume that sending message to WX4MRX-1 should be a coordinated effort much like voice messages are relayed to them. Has anyone given any thought to how this should be done and how coordination will happen?

Or am I worring about the wrong things?

1044. PROBLEM or NOT A PROBLEM ?

Yahoo group: EastTNAPRS
Date: 2005-12-26 03:26:55 UTC
From: Kevin R. Colvin
Topic: 1044 Message: 1044

WE HAVE DISCUSSED THIS BEFORE, BUT I AM STILL AN UNHAPPY CAMPER...

I HAVE AN I-GATE THAT HEAR MY STATION MOST OF THE TIME, WA4YYM. THIS I-GATE IS SHOWN AS MY PRIMARY GATE TO THE I-NET 95% OF THE TIME. (Raw packet:
KF4YMC-1>APU25N,WIDE2-2,qAO,WA4YYM:!3534.75N/08434.26W- PHG4470/ kf4ymc@...) AS REFLECTED HERE FROM FINDU.COM.
WA4YYM HEARS MY STATION DIRECT OVER 80% OF THE TIME.

MY PROBLEM IS, WHY DOSE ANOTHER I-GATE THAT I AM ALSO CLOSE TO SEND MY PACKET BACK OUT.
IF THE MESSAGE WAS DIRECTED TO ME, I COULD UNDERSTAND WHY.
BUT AS SHOWN NEAR THE BOTTOM OF PAGE, WHAT WAS SENT OUT WAS A POSIT WITH A WIDE2-2 PATH.
I DON'T UNDERSTAND AS MUCH AS I NEED TO ABOUT I-GATE's or HOW THEY OPERATE. ALTHOUGH, I WILL BE READING UP ON THEM IN THE NEAR FUTURE.

THIS PROBLEM OF BEING I-GATED BACK OUT IS NOT CONSTANT. SO I SUSPECT IT IS JUST A FLUKE.
ALTHOUGH I HAVE AT TIMES RE-DIGI'd MY OWN MESSAGE AFTER IT CAME OUT FROM AN I-GATE. GOOD THING IT DID NOT GET CAUGHT UP IN A LOOP FROM ME TO I-GATE AND BACK OUT TO ME TO "RELAY" IT OUT AGAIN.
I COULD TAKE RELAY OUT OF MY DIGI's ALAIS PATH, BUT AS A FILL-IN DIGI, SOME MOBILE UNITS USE MY HOME STATION TO GET OUT A LITTLE BETTER.
I ONLY DIGI ON RELAY AND WIDE1-1.
THEN I ALSO WONDER ABOUT THE OUTBOUND PATH ATTACHED TO AN I-GATE. AGAIN, I THOUGHT THEY WERE MORE OF A "LOCAL" ASSISTANCE, 1 or 2 HOPS, RATHER THAN 4 HOPS.
AS SHOWN BELOW YOU CAN SEE I DIGI'd THE STATIONS POSIT OUT, WHICH MEANS "RELAY" or "WIDE1-1" IS THE FIRST HOP. AND KF4CFO-7 DIGI'd IT OUT.
WITH CFO-7 SHOWING 3-2 BEHIND ITS CALL, THIS TELLS ME WIDE 3-3 IS BEHIND THE "RELAY or "WIDE1-1" IN THE PATH
21:37:35R WA4RYW-1>APJI23,KF4YMC-1*,KF4CFO-7*,WIDE3-2 Port=1 <UI Len=61>:
!3550.04NI08414.93W&East Tennessee IPRS IGate, Loudon Co, TN.
I SUSPECT THE POSIT PATH IS ALSO THE SAME AS THE OUTBOUND I-GATED PATH TO BE.
ALTHOUGH, I CAN BE BADLY MISTAKEN.
THIS PATH IS TAKEN FROM ONE OF MY POSIT's I-GATED PATHS:
WA4RYW-1,N4NEQ-3,KF4CFO-7,WIDE3-2* WHICH SHOWS TO BE 5 HOPS, (3 USED AND 2 UNUSED.)

SO I GUESS MY QUESTION THIS TIME IS, WHAT COULD CAUSE THIS FLUKE, OR IS IT SOMETHING I JUST DON'T NEED TO WORRY ABOUT. EVEN THOUGH MY TWO HOP POSIT GETS TURNED INTO A QRMing 5 HOP POSIT, THAT WAS DONE HEARD IN THIS AREA AND BEYOND.

NO PROBLEM ANY MORE, THANKS TO A DIRECT E-MAIL...
I JUST ADDED RFONLY BEHIND MY WIDE2-2, AND NOW I DON'T SE ME GET I-GATED AT ALL, OR AT LEAST THE LAST TWO POSITS I SENT DIDN'T SHOW UP ON FINDU.COM

THANK YOU ---UN-NAME APRS USER---FOR THAT PEICE OF ADVICE

KEVIN / KF4YMC ...HAPPY CAMPER NOW...

From: William McKeehan
Topic: 1044 Message: 1046

The only time my IGate sends a position packet out to RF is when
1) I have seen a message on the internet from a station I do
not hear on RF addressed to a station that I do hear on RF
(up to 1 hop away in the last 30 minutes).
2) I have specifically configured my IGate to always gate packets
for the ID in question (i.e., KI4HDU-3 is always Gated to RF via
my IGate).

I would think that most others operate in a similar fashion...if not, I would
like to understand what their logic is. Does anyone know how UI-View gates to
the internet? What is it's criteria for putting something out to RF?

The path of the new packet seen on RF is a configuration item for me and is
seperate from the path that I use for Position packets from the IGate. Since I
have my station configured to only gate things that are 0 to 1 hops away, I
use a path of WA4KJH-7.

Having said all of that, this packet:
20:30:04R KF4YMC-1>APU25N,TCPIP,WA4RYW-1,N4NEQ-3,KF4CFO-7,WIDE3-2* Port=1
<UI>: !3534.75N/08434.26W- PHG4470/ kf4ymc@...

does not look like it was gated by WA4RYW-1.

A packet gated to RF should look like a 3rd party packet or something like this:
KI4HDU-2>APJI22,WA4KJH-7:}KF4YMC-1>APU25N,TCPIP,KI4HDU-2::KI4HDU-7 :PLSE CHK
IN KEVIN / KF4YMC{18

That's the message packet that got to me last night; it went into some IGate
and came out my IGate (as it was addressed to -7, an RF only station, and my
IGate does not hear you via RF).

But the TCPIP in the packet makes me wonder; maybe UI-View is unwrapping the
3rd party packet and only showing you the inner packet?

WELL, I MAY HAVE INSERTED THE WRONG PACKET TRANSIMITION IN THE SENTENCE YOU REFERED TO.
RE-LOOKING IN MY LOGS, I FOUND THIS :
20:35:03R WA4RYW-1>APJI23,N4NEQ-3*,KF4CFO-7*,WIDE3-2 Port=1 <UI Len=82>:
}KF4YMC-1>APU25N,TCPIP,WA4RYW-1*:!3534.75N/08434.26W- PHG4470/ kf4ymc@...
20:35:06R WA4RYW-1>APJI23,N4NEQ-3*,KF4CFO-7*,WIDE3-1 Port=1 <UI Len=82>:
}KF4YMC-1>APU25N,TCPIP,WA4RYW-1*:!3534.75N/08434.26W- PHG4470/ kf4ymc@...
WHICH BETTER REFLECTS WHAT I WAS IMPLYING.
PATHS ARE STILL SOMETHING THAT I DO NOT FULLY UNDERSTAND, BUT OVER TIME HAVE NOTICED
CERTAIN TRATES THEY HOLD.

MAYBE THIS WHAT EVER WILL HELP TOO....::
20:17:27R KI4HDU-7>APX171,WA4KJH-7*,WIDE Port=1 <UI Len=37>::KF4YMC-1 :got you in -
thanks!{Tj}18
20:17:29R KI4HDU-7>APX171,WA4KJH-7*,KF4CFO-7* Port=1 <UI Len=37>::KF4YMC-1 :got you in -
thanks!{Tj}18
20:17:35R KF4YMC-1>APU25N,KF4CFO-7*,WA4KJH-7 Port=1 <UI C Len=20>::KI4HDU-7 :ackTj}18
20:17:36R WA4RYW-1>APJI23,KF4YMC-1*,KF4CFO-7*,WIDE3-2 Port=1 <UI
Len=52>:}KF4YMC-1>APU25N,TCPIP,WA4RYW-1*::KI4HDU-7 :ackTj}18
20:17:39R WA4RYW-1>APJI23,KF4YMC-1*,WIDE3-2 Port=1 <UI
Len=52>:}KF4YMC-1>APU25N,TCPIP,WA4RYW-1*::KI4HDU-7 :ackTj}18

----- Original Message -----
From: William McKeehan

Topic: 1044 Message: 1048

Well, I can't explain why WA4RYW-1 would be doing what it appears to be doing, but I know someone that can tell us...

Ed? Can you explain why your IGate is doing this? There's got to be some reason, but not knowing how your IGate is configured I'm at a loss to understand.

The only thing that I can think of is that WA4RYW-1 does not hear your station via RF (or maybe has not head it in some amount of time), so he thinks you are some distant station. He has heard my station on RF (via WA4KJH-7, a small number of hops away from him), so he gates the ack packet (that he heard only via the internet) to RF.

That is along the same lines we were going to discuss with Ed on
Thursday.. that and a few other ideas...

Also to help clean up the shack... it needssome good old fashion tlc...

Hopefully we will have eveything in order for the meeting after the
hamfeast so everyone can have look at it and understand what the goals
are... supply him information with out over loading him too much.

73, Good night Moe N4CQW

From: Kevin R. Colvin
Topic: 1052 Message: 1052

I LOOK AT A LOT OF POSIT REPORTS / BEACONS. BUT WHEN I RAN ACROSS THIS ONE, I DID NOT UNDERSTAND WHAT IT WAS. (WA4SXM-10>ID,N4CQW-1*,WIDE:WA4SXM-10/R RELAY/D WA4SXM-1/B)
NOW IF I WAS TO TAKE A STAB IN THE DARK, I WOULD GUESS THAT THIS IS ONE OF THOSE "SO CALLED" UN-NESSESARY "ID" BEACONS. BUT THAT IS JUST A WILD GUESS.
HOPEFULLY, I AM INCORRECT WITH MY GUESS, AND HOPEFULLY, SOMEONE WILL BE KIND ENOUGH TO EXPLAIN WHAT THIS PACKET IS, AND WHAT IT MEANS.

THANKS. . . KEVIN / KF4YMC

MOE,
I WOULD SUSPECT ALL YOU DID WAS WHAT A "HOME" FILL-IN DIGI DOSE, THAT IS DIGI ON "RELAY" or WIDE1-1. IF YOU SEE THIS STATION DIRECT, LOOK AT THE FIRST HOP DESIGANATOR TO SEE IF IT A "RELAY" or W1-1. IF SO THEN YOUR STATION IS DOING NOTHING IMPROPER.

IF YOU WILL NOTICE, SOME "FIXED" STATIONS ARE USING "RELAY" AS FIRST HOP. WHICH WOULD BE FINE IF IT WASN'T FOR THE "HOME" FILL-IN DIGI's (WHICH I AM ONE OF THOSE "HOME" DIGI's) BUT IN AREAS WHERE FILL-IN DIGI's ARE LOCATED, THOSE POWERFULL STATIONS HIT EVERY DIGI THAT SUPPORTS "RELAY". AND AS MORE STATIONS ACT AS FILL-IN DIGI's THE WORSE IT WILL GET THE IF HIGHER POWERFULL FIXED STATIONS KEEP USING "RELAY".

AND REMEMBER, I AM THE ONLY ONE WHO ASK DUMB QUESTIONS.....

Sent: Wednesday, December 28, 2005 1:57 PM
Subject: [Tennessee_Digital_Group] Announcing APRSLink

All,

Please see the information below. Thanks to Bob Bruninga of APRS, and Lee Inman ARES PMBO K0QED of the Winlink development group, for their ideas and efforts.

FYI,

Steve, k4cjx

Winlink 2000 and APRS
==========

After the Amateur Radio response to some recent disasters, Bob Bruninga, WB4APR, presented the idea of using APRS (Automatic Position Reporting System) to enable mobile and remote APRS users to access their Winlink e-mail accounts under emergency or unusual conditions. In response, the Winlink Development Team developed APRSLink.

APRSLink monitors all APRS traffic gated to the worldwide internet and watches for special commands that allow APRS users to:

. Read short e-mail messages sent to their (callsign@...) account
. Send short e-mail messages to any valid e-mail address or Winlink 2000 user
. Perform e-mail maintenance (List, Kill, Forward, Reply, etc.)
. Receive notices of pending Winlink e-mail via APRS messages
. Query the APRSLink server for information on the closest Telpac or PMBO

With the addition of APRSLink, APRS users now have access to full e-mail capability-albeit, only short messages-from almost anywhere; an APRS-enabled radio or APRS client software and a path to an APRS IGate are all that is required. This link between Winlink and APRS should be useful to Amateur Radio operators who find themselves in emergency or unusual circumstances

but need access to an e-mail link into or out of the area.

See http://www.winlink.org/aprslink.htm for additional information.

1056. Re: [EastTNAPRS] PROBLEM or NOT A PROBLEM ?

Yahoo group: EastTNAPRS
Date: 2005-12-30 04:04:38 UTC
From: Ed Dial
Topic: 1044 Message: 1056

I don't know why only YMC's traffic is gating here. If he's messaging a local station, the packet should have never been sent to the IS, but since it was (couldn't have been from here, because my IGate clearly sees HDU as local), it would have had to determine that KF4YMC was NOT local but on the IS, thus gating the packet to local RF (dest. HDU).

There are two things that would have had to happen here. What I described above (the message should have not been pathed to the IS from the source since the destination was local), and my gate would not have recognized YMC as local at the time. I likely would have recently restarted the gate and the local database hadn't had time to populate with YMC's beacon or the original message. It SHOULD have ceased after seeing the first packet from YMC. Does YMC see, or repeat through KJH? Do you (HDU) see him directly? I don't see KJH on his source paths, and he gates through YYM in Cleveland.

I would suggest trying to re-create the event and let me diagnose the event through my gate, and YMC's software. My IGate has been up almost five years now, and I did some really needed maintenance this weekend. The antenna was bad, and I could only hear Keith's digi (KJH), but now I'm hearing five or six. Back to the real point I believe, according to YMCs log here, his software apparently doesn't see you as a local station, or it would have pathed the message packet via RF instead of the IS. I believe that's the real issue.

Excuse me if I'm sounding a bit disconnected. It's been a long week.

Thanks for your input Ed.
Since I (YMC) seem to be the only one haveing problems, I added RFONLY to my WIDE2-2 path.
This of course will stop me from being gated.
Also since I use WIDEn-N and KJH dose not digi that style (yet), it makes more sence now.
(and after checking a terain map, there is a little hill between your station and mine
that, so that could be why your station can't hear me direct.)
I have excluded your call in my home dig to stop from digi'n your packets. They go a lot
farther than mine do, so they don't need my "home fill-in " help.
again, thanks for your input, and the quick responce.

KEVIN / KF4YMC

I don't know why only YMC's traffic is gating here. If he's messaging a local station, the packet should have never been sent to the IS, but since it was (couldn't have been from here, because my IGate clearly sees HDU as local), it would have had to determine that KF4YMC was NOT local but on the IS, thus gating the packet to local RF (dest. HDU).

1058. UX-5 Balloon Launch Saturday, Dec. 31st

Yahoo group: EastTNAPRS
Date: 2005-12-30 05:14:30 UTC
From: Greg Williams
Topic: 1058 Message: 1058

The University of Tennessee Amateur Radio Club (UTARC) is planning to launch the UX-5 balloon on Saturday, Dec. 31. Approximate time for liftoff will be at 1830 UTC, or 1:30 PM Eastern Time.

UTARC will attempt the official distance record for this launch with a CW beacon on HF relaying telemetry and location information as the balloon takes to the air.

The balloon for the launch is designed for distance and longevity, so the flight may last over 24 hours if winds and equipment are favorable.

On UTARC's previous balloon flight, UX-4 was carried aloft by a 200 gram latex weather balloon, and was in the air for an estimated 2 hours, although the transmitter continued to operate for over 36 hours. Predictions indicate it probably landed in Virginia. The transmitter was built by Carl Lyster (WA4ADG) and had a 0.8 watt output. Reception reports were received from as far away as Minnesota, Utah, and British Columbia.

Recovery of the balloon is not anticipated at this time unless the balloon bursts early into the flight. Contact information will be on the balloon in case of a physical recovery.

The telemetry feedback will be in the following format:

Frequency: 14.325 MHz ? 2kHz
Mode: CW
Sequence: AA4UT/B every 15 seconds; full telemetry every 4 minutes as follows:
HI HI AA4UT/B
ALT xxxxxM
LAT xx.xxxxxx(N|S)
LON xxx.xxxxxx(W|E)
SATS xx
TEMP (P|N)xxxC
BATT xx.x VOLTS
SEQ xxxxx
PSE QSL WWW.UTARC.ORG <http://WWW.UTARC.ORG>

Weather forecasts for the launch are not looking pleasant, but UTARC is still planning to launch even if conditions are less than favorable. Weather does not normally affect a balloon launch unless adverse conditions affect the safety of the crew.

As of now, the forecast is as follows:

Saturday: A 30 percent chance of showers, mainly before 8am. Partly cloudy, with a high around 54. West wind between 5 and 10 mph.
Saturday Night: Partly cloudy, with a low around 32.

As with the the last launch, postings on DX Clusters will be made and signal reports can be sent via the web site at http://balloon.utarc.org

This is a long-distance record attempt. Your reception reports will be most welcome and valuable.

Greg Williams, K4HSM

From: William McKeehan
Topic: 1044 Message: 1059

Given that WA4RYW-1 has an improved reception now and is infact hearing KF4YMC direct, I would try removing the RFONLY and begin to watch what happens with your packets and see if you notice any IGate doing anything strange.

I really suspect that the problem was WA4RYW-1 did not hear you; to him, you were a distant station that he only heard via the internet. My station was a "local" station to him via RF, so he was doing exactly what an IGate should do and was gating your message from the internet to me via RF.

With the change in reception at WA4RYW-1, this should no longer be an issue; give it a try.

Ed, it's time to educate me a bit...

You said:
> If he's messaging a local station, the packet should have
> never been sent to the IS,

My IGate will put every packet that it hears onto the APRS-IS (with a few exceptions like packets with RFONLY in the path) regardless if the intended destination is local or not. Is this not standard behaviour?

If you look here:
http://www.findu.com/cgi-bin/msg.cgi?call=KI4HDU-7
you can see messages between my station (only operating on RF) and other local stations.

I found something interesting while playing with WINAPRS today.

I run UI-VIEW on my labtop station, which is my home station that most everyone who can, see's me.
I use my home PC to test / try out other add-on's and programs. and it is set up independtly of my labtop, (it has it's own radio, ant.,etc...).
I had WINAPRS running on my home PC. I saw my station (from ON-AIR labtop station) in the correct area. I decided to enable the compressed beacon option in the UI-VIEW set-up box. When I checked the box, and closed it, a posit beacon was sent out. Then I went to look at the WINAPRS screen and the little yellow house was gone... finally found it out in the ocean...

I was just wondering if anyone had noticed this, or is this something most everyone knows about, and I am the last to find out.

Kevin / KF4YMC

oh yea, when I unchecked the compressed baecon option, and a new posit was sent out, WINAPRS put me back on dry land int the area I belong. . . . .

From: Ed Dial
Topic: 1044 Message: 1064

You're right, an IGate will dump pretty much anything onto the IS that hasn't been configured as an exception, and is one of the major problems with the current state of routing. Some clients, such as APRS+SA will allow you to direct traffic path via IS only. This gives some control if you are Internet connected and send messages, or more practically telemetry cross-country and want to minimally impact local RF congestion, but there's no real control over local RF traffic once the packet hits the radio under the current implementation. The only thing that is being done at the moment is that the IS router/gateways filter duplicate packets submitted to IS from multiple IGates.

Where things were broken in this case was where I was only listening to KJH, and YMC did got repeat through Keith's digi. He never appeared in my "recently heard" table, so I forwarded his sourced messages from IS to RF since you (HDU) WERE in my "recently heard" table. My gate thought it was forwarding a foreign packet to the local RF network. Since I fixed my antenna, I hear YMC via another path, so that should wrap it up. On the downside, I hear stations from Alabama, Florida, and Ohio now, so I may never forward a message from the IS ever again! ;^)

1065. SHORT RANGE FILL DIGI

Yahoo group: EastTNAPRS
Date: 2005-12-30 22:19:16 UTC
From: Kevin R. Colvin
Topic: 1065 Message: 1065

ED,
I have another question for you, I you don't care to answer it.
I noticed WA4RYW-1 Now has the wording "SHORT RANGE FILL DIGI" in the comments.
I was just wondering, what dose your station digi on. I did notice the W1-1 in front of "ETAPRSIG". But I am slowley learning not to make too many assumptions... I get myself into enough trouble as it is...
Thanks,
Kevin / KF4YMC

From: William McKeehan
Topic: 1044 Message: 1066

What software are you using for your iGate?

I'm using javAPRSSrvr. I have mine configured so that "local" stations for me are those no more than 1 hop away (i.e., via WA4KJH-7 since he's the only digi that I hear or direct). Anything that I gate to RF goes out with a short, specific path of WA4KJH-7. What path do you gate things to RF via?

One thing that I have done is configured my IGate to gate all MRX* objects. This allows people who are watching RF only to get the weather alerts without being connected to the internet. I did this initially so I could see them when I was mobile in the area and since have found that others really like this functionality.

Given that you IGate can cover the same area as my IGate, I'm thinking about turning my IGate down to a "backup only" IGate. In this configuration, I would not gate anything from the internet to RF if I have heard your IGate on-line in the last 30 minutes. Does this sound like a reasonable thing to do? I would like to continue to see the MRX alerts, so if you could gate those, then I would be happy.

If I remember correctly, in the past (maybe over a year ago), your IGate was up and down. It would indicate it's status in the status text. I have not seen this indication lately. Has your internet connection stabilized?

1067. Wide Question

Yahoo group: EastTNAPRS
Date: 2005-12-30 23:44:12 UTC
From: Greg Williams
Topic: 1067 Message: 1067

I just put out an announcement about UX-5 on the APRS network with the following path:

WA4KJH-7,WIDE,WIDE2-2

Was this okay to do? Will I "bother" people with this or cause too much clutter?

Thanks
Greg, K4HSM

1068. Re: [EastTNAPRS] Wide Question

Yahoo group: EastTNAPRS
Date: 2005-12-31 00:06:48 UTC
From: William McKeehan
Topic: 1067 Message: 1068

Paths are just directions telling "the network" how far you want your packet (in this case, bulletin) to go. The path that you used is 4 total hops starting from WA4KJH-7. I have found that getting a message to travel 4 hops is nearly impossible on RF, so your bulletin may not make it the full 4 hops. If your bulletin made 4 hops, then I would estimate that it traveled up to 300 miles in each direction. The only way to determine how far it made it, you'll have to ask who saw it and see how far away they are.

In general, for announcements such as this, I use 2/3 hops with a path of WA4KJH-7,WIDE or WA4KJH-7,WIDE2-2. Like everything in APRS, the path is only long if you did not want your message to travel that far. Given that you want people a long way off to monitor the HF frequency for the balloon, I think the 4 hops may be appropriate in this case.

Just my 2 cents.

From: Ed Dial
Topic: 1065 Message: 1071

Yeah, the only alias is WIDE1-1. It's a fill-in for the I-75/I-40
junction area that's in a huge hole. The only thing, most people
around here are still using RELAY, so it will be of limited use until
the conversion is complete.

The same, except I gate to RF with WIDE2-2. I need to transmit
telemetry data to Atlanta, Nashville and Greeneville.

>One thing that I have done is configured my IGate to gate all MRX* objects.

It's up to you. I would have no problem forwarding MRX objects.

Yeah, actually it's been up continuously for almost five years, and
three years before that in Denver, it just seems like lately it has
performed POOOOORLY. I had severe antenna trauma around a year or two
ago, and have been operating on a makeshift rig which really didn't
work much better than the traumatized antenna. Literally, I couldn't
get enough signal into the air for KJH to hear me some of the time.
Thanks to an extended Christmas holiday and a couple o' sunny days,
that's all better now. I have also made vast improvements to the
IRLP/Echolink link radio (all services run on the same common Fedora
Core 3 server). Over Thanksgiving, I upgraded the server from RH 7.3
to Fedora Core 3, (server uptime at upgrade was 394 days!) and
replaced the Pentium 3/500 PC with a Mini-ITX VIA C3 Nehemiah
processor. Anothe thing I did in November was get off Bellsouth DSL

and move to Charter Cable. Much more stable. The VPN to Atlanta
hasn't reset in almost two weeks! The entire equipment stack is now
smaller than the old PC used to be. Now if I can only get Keith to
repair the repeater. Another bad antenna/feedline scenario, and
repeat audio is attenuated by about 10 dB. We are both quite the
procrastinators when it comes to tower climbing.

I have turned my IGate into a backup only IGate. It will still gate everything
it hears from RF to the internet, but will no longer gate anything to RF as
long as I hear WA4RYW-1 on the air. If you would add "MRX" to your
IGatePassPrefixes, I would be perfectly happy!

Is there any way to make javAPRS not transmit when it looses it's connection
to the internet?

I'm not using a conventional telemetry UI packet, I have one byte on
the status message that I scan for that gives me eight status/control
bits. The Knoxville/Atlanta circuit is IRLP control from RF anywhere
I can access the APRS network, and the Greenville Nashville thing was
a trial IRLP simulcast control mechanism. There's all kinds of
embedded telemetry in APRS packets that don't use the telemetry frame.

I don't think it can be done at current version. That would be a good
feature request for Pete Loveall. It would certainly make sense that
it would do that.

Very interesting! I would have never thought about something as simple (simple meaning using one byte in the status message, not in concept or design)!

[snip]

Great! I have not seen any objects from your station yet, so for right now (knowing that we are expecting an event later tonight/tomorrow), I will leave my station also gating the MRX packets; once I start seeing the packets from your station via RF, then I will discontinue my gating of those packets.

I think I will ask about the backup feature and describe our situation and see if Pete has any ideas on how to let us work together better (given that we both use software built by him). We'll see if he has any suggestions for improvement.

Thanks again for everything Ed!

I just did a "reload". It might take a full restart to change. How
often do these packets come through? Meanwhile, I'll hard-restart the IGate.

1079. Comment on "WX" gating

Yahoo group: EastTNAPRS
Date: 2006-01-01 20:52:22 UTC
From: Scott
Topic: 1079 Message: 1079

It would be helpful to gate MRX, HTX, OHX, and SPC. That gives you Morristown, Hy Top, Nashville, and Storms Prediction Center. That cover everything we get he in E TN. (The OHX-Nashville covers the western edge of E TN, and is a HUGE help in looking for what is coming.)

The reason for doing all 4 is that MRX does not put out everything. Watch boxes for tornadoes and such come from SPC. Also, HTX puts out some of the southern E TN stuff.

We is being a royal pain, ain't we!!

No, it's no problem at all. That's what APRS is for.

Would someone send me an example packet for what we're looking for?
I've been monitoring the IS for ANY packet containing "MRX", and
haven't seen anything in the last two hours. Are they relatively rare?

Interestingly enough, the last "MRX" packet that I have seen was at
7:46 this morning...but here are some samples from earlier:

MRXSWO>APRS,TCPIP,KI4HDU-2*:;MRX_OUTLK*021015z3600.60N\08334.20WyCheck

I'm sure the gate software is far more advanced than UI-VIEW32, but
what we di in them is set up a filter to let through anything with
MRX, HTX, OHX, or SPC in the beginning of the label (and probably
call) That's the only thing that will ever use those three letter in
the first of each one.

That probably doesn't help much...

Thinking about it; for me to be a backup to your station, I probably need to configure my IGate similar to yours. You want to drop me a note off-line with your config file (or the relevant parts) for me to duplicate?

So far so good on the gating of WX objects to thr RF side of APRS.
I've been on RF for about 15-20 minutes, and already see objects from
MRX, OHX, and SPC. Guys, simply put, this action helps save lives, period.

Yes I was earlier.

Here at my QTH I am RXing all WX data sent through RYW's gate, and
looking VERY good! The whole valley area should be able to see the
data now via an RF connection. This is a VAST improvement. Ed, you are
to be commended!

1087. Suggested APRS / SKYWARN Object Posting Guidelines

Yahoo group: EastTNAPRS
Date: 2006-01-03 00:23:51 UTC
From: Scott
Topic: 1087 Message: 1087

As we all know, amateur radio operators are pretty much responsible for the formulation of how a system works. That is evident by the dedicated members of this group, and by the results we are having in E TN APRS.

The following is an effort to offer a suggested guide for posting APRS / SKYWARN objects. PLEASE, PLEASE, PLEASE, this is not critism, but an effort to help improve what we do. This needs input and development, and also approval from Ed, Howard, and others involved with Skywarn at MRX.

||||||||||||||||||||||||||||||||||||||||||||||||||||||||||||||||||||||||

APRS SKYWARN OBJECT POSTING

(1) Objects posted by APRS stations should indicate only severe weather, matching the criteria set forth by the NWS. The criteria is as follows:
Total rainfall of 1 inch or more for an event
Hail 3/4 of an inch or greater (dime size or greater)
Wind gusts of 58 mph or greater (please indicate whether winds were measured or estimated)
Tornado
Flooding of rivers or streams, or flooding that threatens life or property
Weather related damage to buildings, trees, or vehicles

(2) Objects posted should be a direct result of conditions at the operators QTH, or reported in to an established Skywarn net, for that local area only. It might be best practice to assign one station in the net to do such posting.

(3) Objects should only be left on screen:
(a) Long enough for the operators at MRX to see and verify them.
(b) As long as the event the object denotes is actually happening.

EXAMPLES:
(1)Station "X" posts an object denoting Nickel sized hail at 444 CR 555. The NWS acknowledges the object, and it is removed by either the original poster of the NWS operator.

(2)Station "X" posts an object denoting a funnel cloud at 222 SE MAIN. Object is moved as the funnel movement reports are taken, and removed from screen when it has disipated.

(4) No objects should be posted that are "similar" in nature to actual MRX, HTX, OHX, or SPC objects, unless MRX requests an operator to do

so. Some of these may include:
(a) SVR THUNDRSTORM plots
(b) Severe Wx Advisory plots
(c) MesoScale
(d) Tornado Watch
(e) Svr TStormWatch
(f) other known WX service posted objects, such as those posted via the internet, with the letters "MRX", "HTX", "OHX", "SPC", etc in the beginning of their label.

REASONING:
(1) The NWS and its offices are the only agency having proper authority to post such objects.
(2) The NWS does a good job of projecting travel of WX, and has the proper equipment to do those projections.
(3) Posting of "look-a-likes" causes confusion and clutter on screen.

||||||||||||||||||||||||||||||||||||||||||||||||||||||||||||||||||||||||||||

As I said, this is only a suggestion, base partly on my experience a Skywarn District 3 Rep, a general knowledge of how APRS works, and viewing actual operation of APRS during Skywarn in E TN and other areas. Others may have better ideas.

Scott NA4IT

1088. "Fill-in" or "Home" digi's

Yahoo group: EastTNAPRS
Date: 2006-01-03 01:30:24 UTC
From: Scott
Topic: 1088 Message: 1088

Since there are more and more users getting on APRS in E TN, I believe we are going to really look at setting and need for "fill-in" or "home" digi's.

A fill-in digi is basicly a digi that will repeat a mobile or low power station with "RELAY" or "WIDE1-1" in it's path. Being a fill-in at a rate if WIDE2-2 or higher will theoreticly jam the system, if there are several doing it.

Take KF4CFO-7 and our local area here in McMinn & Meigs counties. A few months ago, we scaled back CFO's digi so that it will not digi anything larger than WIDE3-3. That is because it is not really a high profile digi, but does serve both counties well. It can be heard and hit from almost anywhere in the county with a mobile rig.

My home station (when on and I do it) digi's at RELAY and WIDE1-1 only. There is no need for it being higher than that, and most of the time, I don't have the digi turned on.

I noticed tonight, with WA4RYW gating the WX stuff, there were several extra hops that were not needed, and it wasn't him or WA4KJH-7 doing it...it was all the "fill-in" or "home" digi's.

We are well on the way to having a great system in E TN. Let's don't break it before it is fixed!

Just constructive comments and observations. Think about if you really need to be a digi. I know most of the time, I DON'T.

Topic: 1087 Message: 1090

WELL HERE IS MY THOUGHTS.
AS MANY PACKETS AS I SAW IN SUCH A LITTLE AREA, JUST WAS ONE BIG BLOB.
MAYBE IF THEY WERE DIRECTED TORWARD WX4MRX RATHER THAN THE STATIONS ALOHA AREA, THAT MIGHT HELP. IF KNOX , BLOUNT, MONROE,MIEGS,LOUDON AND ALL THE REST OF THE COUNTIES WERE SENDING OBJECTS AT THE RATE I SAW,,, 200% USAGE + SO WE KNOW WHAT THAT MEANS.. PACKET CRASHES... NO TRAFFIC PASSED..
I UNDERSTAND THIS IS IN THE BABY STAGE AND WE ALL ARE LEARNING. BUT THINGS GOT SO BAD I SHUT OFF MY HOME FILL-IN DIGI AND SET MY BEACON RATE TO 1 AN HOUR. WHICH SOME MIGHT SAY IS ALL I NEED, BUT, WE NEED TO FIGURE OUT AND MONITOR WHAT IS GOING ON BEFORE IT ENDS UP NOT WORKING AT ALL. WE HAVE THE MAKINGS OF A GREAT SYSTEM. AND THINGS ARE MOVING FORWARD, LETS ALL BE CAREFULL AND NOT JUMP TO FAR TOO FAST..
KEVIN / KF4YMC

Subject: Re: [EastTNAPRS] Suggested APRS / SKYWARN Object Posting Guidelines

Scott,

ALL this is being done with The National Weather Service (NWS) approval and blessing. I spoke in great detail with The Head Meteorologist (I forgot his name), Ed,Jeff KF4UVT and the rest of the group there that day. They like what we do and how we do it. We had all the on duty meteorologist and the 2 service technicians who help keep them running watching the log.

1091. Re: "Fill-in" or "Home" digi's

Yahoo group: EastTNAPRS

From: William McKeehan
Topic: 1088 Message: 1091

I totally agree.

I would suggest that anyone who is considering bringing up a home digi to set it up to respond ONLY to aliases of RELAY and WIDE1-1 (and your callsign).

I would further suggest that if you are considering bringing up a digi that you think is a high-level digi that you discuss the location and configuration in this group. There are members of this group who have been active in Packet or APRS for many years and there are others that have a vast understanding of RF networks in general. Please take advantage of that knowledge as we try to improve the network.

Scott is 100% correct that too many digi's will only reduce the reliability of "the system".

On Mon, January 2, 2006 8:30 pm, Scott said:

HERE IS MY THOUGHTS ON THIS.
I "HAD" MY HOME STATION SET UP AS A HOME/FILL-IN DIGI, ONLY RESPONDING TO RELAY AND WIDE1-1, UNTILL THIS AFTERNOON. NOW IT IS SHUT OFF.. THERE IS NO GOOD REASON I SHOULD BE DIGI'N FIXED HOME STATIONS THAT ARE 30 MILES OR FARTHER AWAY FROM ME.
SO IF YOU ARE MOBILE OUT MY WAY, AND USING RELAY OR WIDE1-1. I AM SORRY, I AM NO LONGER A FILL-IN / HOME DIGI... OR ATLEAST UNTIL I GET OVER BEING UN-HAPPY ...

Subject: [EastTNAPRS] Re: "Fill-in" or "Home" digi's

I totally agree.

I would suggest that anyone who is considering bringing up a home digi to set
it up to respond ONLY to aliases of RELAY and WIDE1-1 (and your callsign).

Kevin makes a good point.

If you have a home station that can be heard by one of the big digi's direct, then please eliminate RELAY and WIDE1-1 from your path. If you can be heard by a big digi, either use that digi's call sign as the first element in your path or the generic WIDE (or in the case where the digi supports WIDEn-N, use WIDE2-2 or whatever is appropriate for your area).

RELAY (or WIDE1-1) should be used by low powered or mobile stations as the first item in their path. Putting RELAY or WIDE1-1 further down the path causes multiple home digi's to respond and generates unnecessary packets (and thus channel congestion).

From: Jeff Yawn
Topic: 1087 Message: 1094

No problem. We do have MRX on board with this.
We (n4cqw, w4vgi and myself) Showed them this last week while we were up there. They loved it. It is a great graphical of what is going on and where. Once they post a warning they pretty much have to look on a map to see the area or look on radar and try to find the exact area a report comes from. Other than the actual radar and county maps they really have no good way to see what is REALLY happening.
They asked if we could put the text for each item in the same format they are used to, so they would be able to look up know what is there with no new learning curve. They plan to put an APRS map either on a central computer for the Meteorologists or on a media projector on the wall everyone can see.

They are going to give us a list of terminology to use with the items if Moe does not already have it. We still have a few things to work out with them as for how long to keep items up there and such. Right now there are only 2 people posting locally from reports that come in via voice.

This is a new learning curve for us so we'll have to struggle through but MRX is VERY excited about this and they have offered to help as much as possible to get this done including getting us a new computer for the shack at WX4MRX.

Good stuff happening here. We showed them the door and they ran in and said WAY COOL how can we get this where we can all see it.

BTW Moe his name was Dave Hotz, Science and Operations Officer

Subject: [EastTNAPRS] Suggested APRS / SKYWARN Object Posting Guidelines

As we all know, amateur radio operators are pretty much responsible
for the formulation of how a system works. That is evident by the
dedicated members of this group, and by the results we are having in E
TN APRS.

The following is an effort to offer a suggested guide for posting APRS
/ SKYWARN objects. PLEASE, PLEASE, PLEASE, this is not critism, but an
effort to help improve what we do. This needs input and development,
and also approval from Ed, Howard, and others involved with Skywarn at
MRX.

||||||||||||||||||||||||||||||||||||||||||||||||||||||||||||||||||||||

APRS SKYWARN OBJECT POSTING

(1) Objects posted by APRS stations should indicate only severe weather, matching the criteria set forth by the NWS. The criteria is as follows:
Total rainfall of 1 inch or more for an event
Hail 3/4 of an inch or greater (dime size or greater)
Wind gusts of 58 mph or greater (please indicate whether winds were measured or estimated)
Tornado
Flooding of rivers or streams, or flooding that threatens life or property
Weather related damage to buildings, trees, or vehicles

(2) Objects posted should be a direct result of conditions at the operators QTH, or reported in to an established Skywarn net, for that local area only. It might be best practice to assign one station in the net to do such posting.

(3) Objects should only be left on screen:
(a) Long enough for the operators at MRX to see and verify them.
(b) As long as the event the object denotes is actually happening.

EXAMPLES:
(1)Station "X" posts an object denoting Nickel sized hail at 444 CR 555. The NWS acknowledges the object, and it is removed by either the original poster of the NWS operator.

(2)Station "X" posts an object denoting a funnel cloud at 222 SE MAIN. Object is moved as the funnel movement reports are taken, and removed from screen when it has disipated.

(4) No objects should be posted that are "similar" in nature to actual MRX, HTX, OHX, or SPC objects, unless MRX requests an operator to do so. Some of these may include:
(a) SVR THUNDRSTORM plots
(b) Severe Wx Advisory plots
(c) MesoScale
(d) Tornado Watch
(e) Svr TStormWatch
(f) other known WX service posted objects, such as those posted via the internet, with the letters "MRX", "HTX", "OHX", "SPC", etc in the beginning of their label.

REASONING:
(1) The NWS and its offices are the only agency having proper authority to post such objects.
(2) The NWS does a good job of projecting travel of WX, and has the proper equipment to do those projections.
(3) Posting of "look-a-likes" causes confusion and clutter on screen.

||||||||||||||||||||||||||||||||||||||||||||||||||||||||||||||||||||||

As I said, this is only a suggestion, base partly on my experience a Skywarn District 3 Rep, a general knowledge of how APRS works, and viewing actual operation of APRS during Skywarn in E TN and other areas. Others may have better ideas.

I SHUT MINE OFF FOR I REASON, AND IT WAS NOT TO HURT THE ONES WHO NEEDED IT. IT WAS SIMPLY TO PREVENT MY STATION FROM ADDING TO MORE CLUTTER TO THE AIR WAVES.
UNTIL I CAN FEEL ASURE THAT I AM NOT CAUSEING A LOT OF QRM, (THE THING I COMPLAIN ABOUT MOST). IT WOULD BE BEST FOR ME, TO HAVE MY DIGI OFF.

I guess I am like Kevin...

The digi is totally turned off so if your mobile I will no longer support you if your in a bad spot to the West and North of Knoxville... this is all Greek or Geek in some cases but I am not sure what to do help anymore...

SO why bother anymore....? Danged if you do danged if you don't!

30 MINUTES AND 302 PACKETS (+/-) THAT I RECEIVED.
302 PACKETS TIMES 3 SECONDS PER PACKET(EST.) = 906 SECONDS
30 MINUTES TIMES 60 SECONDS = 1800 SECONDS
AND THAT IS JUST WHAT MY HOME STATION HEARD.
SO YES 200%+ IS NOT THE CORRECT ANSWER. BUT I USED IT TO MAKE A POINT.
AND YES 3 SECOND PACKETS MAY SEEM TOO LONG .
BUT MY POINT IS, IF ALL OF THESE PACKETS ARE NOT TIMES JUST RIGHT, SAY 3 SEC ON THEN 3 SEC OFF AND REPEAT AGAIN,
THERE IS GOING TO BE A GREAT LOSS. AND IF MORE STATIONS GO TO REPORTING, THAT ADDS MORE PACKETS.. AND EVEN THOUGH SOMEONE MIGHT SET A GUIDELINE, WE ALL KNOW WHAT SOME PEOPLE THINK OF GUIDELINES...

IF MRX NEEDS SO MUCH ASSISTANCE, I WOULD THINK ABOUT USING THE INTERNET TO SEND REPORTS vs RF. THE INTERNET CAN SUPPORT A LOT MORE THAN RF.
ONE COULD EVEN THINK OF SETTING UP A UHF SYSTEM TO USE THAT COULD GATE INTO THE INTERNET AND THAT WAY IT WOULD NOT CONJEST 144.390.

THEY ARE MANY WAYS TO DO WHAT WE NEED TO DO. WE ALL HAVE OUR OWN IDEAS. NOT ALL OF US WILL AGREE WITH EACH OTHER, BUT THRU COMMUNATIONS WE COULD, COME UP WITH IDEAS THAT MIGHT BE EVEN BETTER THAN WE WERE HOPING FOR...

I LIKE THE IDEA OF ASSISTING MRX, BUT I DO NOT LIKE THINGS FORCED ON ME. AND APRS IS NOT EXCLUSIVE FOR WEATHER USE.

SO BY NOW I HAVE PROBLEY MADE SOME DISCUSTED WITH ME, WHILE OTHERS AGREE WITH ME. BUT THAT'S NOT WHAT ALL THIS IS ABOUT... IT IS ABOUT TRYING TO WORK TOGEATHER AND GET THINKS DONE. I DID NOT SET OUT TO RUFFEL ANYONES FEATHER, SORRY IF I HAVE.

KEVIN/KF4YMC

1099. APRS / SKYWARN & Digi's comments

Yahoo group: EastTNAPRS
Date: 2006-01-03 05:11:12 UTC
From: Scott
Topic: 1099 Message: 1099

First and foremost, all these posts are to help keep a good system running, and make a good system better. No one, no one, needs to get offended here. My word, when I got into APRS, I was green as a gourd, and made hundreds of mistakes. You know why? All I had to go on was what one man who lived somewhere else had said in guides that were supposed to be the "fix" for everywhere. Now, we have a dedicated group of folks in a specific area, that has some pretty tough obstacles to over come (MOUNTAINS!). And I believe we can ALL work together and get it right.

Second, anytime one of us in our area (usually me or Kevin) helps someone get APRS setup, we recommend very strongly that mobile / portables run WIDE1-1,WIDE2-2 as the beacon path, with home stations WIDE2-2 (yea I know, KF4CF0-7 is still WIDE WIDE, that is getting changed tomorrow (Tuesday)). We also caution folks about running "fill-in" or home digi's and again strongly recommend they only run RELAY,WIDE1-1 (their callsign is a given) if at all. That is what we have learned from the postings on this group.

Third, if that's what MRX wants, then that is exactly what they need to get. As I said, that was a SUGGESTION. I am in no way trying to run the show, don't want to, never have, never will. I run McMinn County's nets the way they have been run for years, and that is we don't report it unless it is severe criteria. I also learned that from Rocky Beckner, who spear headed the amateur radio end of Skywarn for sometime.

Fourth, as far as the packet traffic tonight, I believe careful use of the fill-in digi's (which may mean turning them off during severe WX) will fix anything that is going on. As far as what is seen on screen in the 146.940 area net, that is their business. Anyone can redo maps, or zoom, to see what is going on.

If everyone believes it ain't broke, then there is nothing to fix. Personally, if someone outside my area saw something wrong, or had a suggestion how to make it better, I would want to know it. That includes even turning KF4CFO-7 off if need be. But, when we have a need for it here, it will be on.

As for us in this area, which are becoming quite a good number, KF4CFO-7 is the only way we hear anything on APRS. Several years ago, when Rocky tried to get APRS setup at MRX, he told me if McMinn could ever get even a small digi set up to help him get into and out of the south area, it would be great. That's why it is there. He never got to see it, but I know from comments I have read and been told, many folks appreciate it being there.

I am ignorant to a lot of things, being new to APRS.

What about using another frequency? Set up a digi on another mountain and communicate with WX4MRX on that, and have someone set up an I-gate to "crossband digipeat" on to 490?

If setting up the objects created so much traffic, would an alternate freq be advisable?

Greg.

Greg,

All in all, that may not be a bad idea. That's what has tried to be done by moving the NCS stations for individual groups / counties to 220MHz on voice. That way the ops at MRX aren't having to listen to 20 or 30 repeaters at a time. Even a 2M freq might be good. Someting to think about....

GREG,
IRT THE UHF SYSTEM I MENTIONED. IT WOULD BE A HOLE DIFFERENT SYSTEM THAT WOULD GATE TO THE INTERNET, AND NOT USE 390 FOR THE WX REPORTING. NO CROSS OVER. AND BY I-GATING TO THE INET, A USER CAN HOOK UP TO THE APRS SERVER AND SEE ALL THE INDIVUAL REPORTS. IT IS JUST AN OPTION, AND WOULD OF COURSE REQUIRE SOMEONE SETTING UP OF A NEW UHF DIGI AND THE APRS USERS WANTING TO USE THAT UHF BAND WOULD HAVE TO SET UP SOME UHF EQUIPMENT. I DO NOT FULLY UNDERSTAND IT, SO I AM NOT THE BEST PERSON TO EXPLAIN IT... IT WAS MEARLY ANOTHER OPTION, EVEN THOUGH, IT MAY HAVE NOT BEEN A GOOD ONE.
NO YOU ARE NOT IGNORANT. WE ALL ARE STILL LEARNING.. ME INCLUDED.. THATS IS ONE THING THIS GROUP IS ABOUT. LEARNING...AND I HAVE A LOT YET TO LEARN...

From: Scott
Topic: 1103 Message: 1103

As far as I can tell, after visiting a list of google search "APRS Skywarn" websites, what we are trying to do is in it's infancy. No, not merging APRS and Skywarn, that's been done. But not like we are doing it. Here's what I have read about the methodolgy:

(1) Use APRS to gate Internet WX traffic out to RF.
(2) Use APRS to send text messages to WX office.
(3) Use APRS to locate reporting stations.
(4) Use APRS to overlay stations on radar screens.
All the above has been abd is being done.

But, I have found no mention of using APRS to place actual objects denoting where the severe wx is happening. They basicly have said "well, it's 1 mile north of where station KK5XXX is". Oh I'm sure one or two stations have played with it. But not as a coordinated effort.

So, if we are doing it in it's infancy, then, we owe it to the NWS, to amateur radio, and to the public they protect to get it right.

It's a good idea. When it was first mentioned, I had thought of it as a possiblilty along with several others of you. (Lord knows, I wasn't the first!) It just needs a little "tweaking". If we work together, well get it there.

I think all in all it would be better left on the national APRS freq. We just have to figure out how to (1) reduce the traffic to only what is needed and (2) accomadate that traffic through a coordinated effort.

Once we get it right, then we can teach others how to do it successfully, and not have to scratch their heads until they are bald how to do it.

(You guys just realized what I insinuated didn't you? THAT WERE GONNA BE A BUNCH OF BALD HEADED OL GEEZERS WHEN WE "GIT ER DONE"! haha)

Topic: 1103 Message: 1104

You'all remember when we did the MS Bike ride in 2005? How we couldn't get APRS to work right, and on Sunday, when everyone came down to the church where the trailer was, how all the APRS units were QRMing the voice freq so bad I couldn't hear? We'll, we learned some lessons then. Some of the stuff worked, and some of it was a real bad idea. And you know what, we can use that to make it work when we get it going. (Word has it there are a couple of hams aorund that would be willing to run APRS in the ride, and one ham who Santa gave a Kenweed APRS HT who is looking for a GPS so he can ride a motorcycle and lead the pack...hmmm.) [I also learned if you turn off the DSP Automatic Notch in a 706, it won't kill the incoming APRS packets...duh.]

From: William McKeehan
Topic: 1088 Message: 1105

Moe,

Before you turn off your digi, I would suggest you have a look at
the number of stations that your are helping by operating the digi.

http://www.db0anf.de/hamweb/aprsdb/showdata/n4cqw-1/shdigiusers?
sortdigiusers=ld

As as RELAY,WIDE1-1 digi, I think your station is in a good location.

Anyone else willing to share an opinion about this?

William

From: Scott
Topic: 1088 Message: 1106

One thing to remember on the setup of digi in UI-VIEW is to remember not to check "WIDEn-n". The WIDE1-1 in the alias takes care of the WIDEs we want to digi. And I think that may be a common mistake. I have done it.

1107. UI-VIEW digi setup

Yahoo group: EastTNAPRS
Date: 2006-01-03 13:57:11 UTC
From: Scott
Topic: 1107 Message: 1107

I added a screen shot of how to set UI-VIEW as a Home or Fill-in digi
in the files section. Look for:

uiview digi setup.jpg
UI-VIEW Home of FIll-in Digi Set-up Screen

Topic: 1088 Message: 1109

I noticed that WA4BDS's call is in this list, twice.? This list appears to show something other?than just how N4CQW-1 is helping the APRS communiity.? How can one obtain such a list as to how much good a digi is actually doing?? What does a list like this show other than whether an APRS station is using N4CQW-1 as their digi / uplink.? This just?means that in the case of WA4BDS, he was heard by N4CQW-1, right?? I'm sure WA4JKH-7 hears WA4BDS?without going through N4CQW-1.? So how does this help?

1110. another weird note about www.db0anf.de

Yahoo group: EastTNAPRS
Date: 2006-01-03 19:25:55 UTC
From: David Hoffman
Topic: 1088 Message: 1110

Another interesting note, http://www.db0anf.de/hamweb/aprsdb/showdata.php?cfrom=ke4fgw-9?actually has me in a different location than http://www.findu.com/cgi-bin/find.cgi?ke4fgw-9.? findu is correct.? However db0anf report's my last heard packet correctly.? It just maps me in a total different location, 115 miles away.? Weird.

David Hoffman - KE4FGW

1111. Re: [EastTNAPRS] Suggested APRS / SKYWARN Object Posting Guidelines

Yahoo group: EastTNAPRS
Date: 2006-01-03 21:08:43 UTC
From: Jeff Yawn
Topic: 1087 Message: 1111

Of the 302 only 42(unless I missed one or two) were weather related and of those MOST were from the NWS not objects posted by hams.

I agree we have a problem with the paths that are being used when the same stations gets digi'd 4 or 5 times. And Mine is one of those some times but I have tried to use other paths and none work consistently. I am testing a new digi to cover areas where the coverage is spotty at best if at all. It will NOT be set up on any standard path. If someone needs to use it they will have to use the selected path. This should eliminate any dupes coming from this new digi. Also when we send out an item once it only goes out ONCE not 4 and 5 times.

I use relay,wide because I have to. Most of the time I am not even on the map. Until we fix it all, this problem of dupes will never go away.

Jeff

$ULTW00640096021A0000----0000A3660001----0001042400000035

30 MINUTES AND 302 PACKETS (+/-) THAT I RECEIVED.
302 PACKETS TIMES 3 SECONDS PER PACKET(EST.) = 906 SECONDS
30 MINUTES TIMES 60 SECONDS = 1800 SECONDS
AND THAT IS JUST WHAT MY HOME STATION HEARD.
SO YES 200%+ IS NOT THE CORRECT ANSWER. BUT I USED IT TO MAKE A POINT.
AND YES 3 SECOND PACKETS MAY SEEM TOO LONG .
BUT MY POINT IS, IF ALL OF THESE PACKETS ARE NOT TIMES JUST RIGHT, SAY 3 SEC ON THEN 3 SEC OFF AND REPEAT AGAIN,
THERE IS GOING TO BE A GREAT LOSS. AND IF MORE STATIONS GO TO REPORTING, THAT ADDS MORE PACKETS.. AND EVEN THOUGH SOMEONE MIGHT SET A GUIDELINE, WE ALL KNOW WHAT SOME PEOPLE THINK OF GUIDELINES...

IF MRX NEEDS SO MUCH ASSISTANCE, I WOULD THINK ABOUT USING THE INTERNET TO SEND REPORTS vs RF. THE INTERNET CAN SUPPORT A LOT MORE THAN RF.
ONE COULD EVEN THINK OF SETTING UP A UHF SYSTEM TO USE THAT COULD GATE INTO THE INTERNET AND THAT WAY IT WOULD NOT CONJEST 144.390.

THEY ARE MANY WAYS TO DO WHAT WE NEED TO DO. WE ALL HAVE OUR OWN IDEAS. NOT ALL OF US WILL AGREE WITH EACH OTHER, BUT THRU COMMUNATIONS WE COULD, COME UP WITH IDEAS THAT MIGHT BE EVEN BETTER THAN WE WERE HOPING FOR...

I LIKE THE IDEA OF ASSISTING MRX, BUT I DO NOT LIKE THINGS FORCED ON ME. AND APRS IS NOT EXCLUSIVE FOR WEATHER USE.

SO BY NOW I HAVE PROBLEY MADE SOME DISCUSTED WITH ME, WHILE OTHERS AGREE WITH ME. BUT THAT'S NOT WHAT ALL THIS IS ABOUT... IT IS ABOUT TRYING TO WORK TOGEATHER AND GET THINKS DONE. I DID NOT SET OUT TO RUFFEL ANYONES FEATHER, SORRY IF I HAVE.

Topic: 1088 Message: 1112

WA4BDS is in the list twice because both of his station were 1) heard by N4CQW-1 and were digipeated by N4CQW-1.

Looking at this list alone will not tell you how effective a digi is. It will give you some idea as to how often a digi is used to get a packet to the internet.

This web site let's you do some further analysis (click on WA4BDS's id in that view). You will see that for the most part, WA4BDS depends on WA4KJH-7 (5892 packets) to get to the internet.

As with any data collected via the APRS-IS, you don't get the entire picture just by looking at internet data. Watching the packet traffic on local RF is the only real way to tell what's going on and even then you have to remember that the path you choose may cause your packets to go beyond the local area, so what you alone hear is not the entire picture either.

You've been doing this stuff for longer than I have...what are your thoughts?

From: William McKeehan
Topic: 1088 Message: 1113

I have two things to say on this topic.

#1
97.67(b), states that " . . amateur stations shall use the minimum amount of transmitter power necessary to carry out the desired communications."

I believe in the Packet world (and thus the APRS world), this includes using the shortest (and most specific) path possible to carry out the desired communication. For example, if you want to get a message to WX4MRX-1 and you can talk to WA4KJH-7 directly, then the proper path for that message would be "WA4KJH-7".

#2
Those of you who are "giving up" and taking your toys home to play by yourself. Grow up. Alot of us are new to APRS - like anything else, it's a learning experience. If there are problems, then let's be adult and discuss them. Don't throw stones and run, stay and provide your point of view (note that some things that you see as problems may not problems for others) and try to make the system better for everyone.

I really enjoy APRS - I know that we can use the lessons learned from this night of high-activity to better understand how APRS works and thus improve our understanding and use of the network.

William

I guess you have seen some of the discussion on this board about my efforts to get an APRS system on my Motorcycle.

Getting a good antenna setup is key to good operation with only five watts.

I would love to see APRS used in the MS Bike Ride 2006. I would love to see it to indicate location of the lead rider, last rider. Then it could be expanded to track the location of supply truck, ambulance (s), mechanic trucks, etc (anything to eliminate the need for NetControl to ask on voice "where is x").

Put my name in the hat to help out again this year...I'll do whatever you want me to do including running the route all the way both days.

I never really got down into the nitty gritty of the hows and whys of how?things worked like it does.? I'm reading and learning just?like the rest of you from this group.? I just wish I had the time to watch packets and learn more about their paths.? Just when I thought I had the whole concept down, someone paints a new picture that makes sense.?
William, I like your idea of getting everyone to download and install UI-View and using the APRS nets to fuel progress and/or questions experiienced during the installation.? I think it's a great start for the new year and I hope to join in on the fun.? I want to see what the BIG to-do is about UI-View32, so now's my chance.? Thanks

Maybe we need to schedule a couple of days where a group of us gather at a convenient location (say a park or something) and setup an APRS network (all low powered on some freq other than 144.39) and play with a few things to give us all a better understanding of path's and how they work.

What do you all think about this idea?

1119. UI-View Tutorial

Yahoo group: EastTNAPRS
Date: 2006-01-04 00:12:11 UTC
From: William McKeehan
Topic: 1088 Message: 1119

I'm glad that you like the idea; it's one that I had been thinking about for a few weeks and thought that the start of the new year would be a great time to start it. I hope to have a topic for every week and so far, it's been easy to think of enough to provide me with material for months.

With this UI-View tutorial, I would like to ask all of you UI-View users to be as active as possible in this effort. I am not a regular user of UI-View and thus may leave out some important things in telling people how to do things.

For starters, if you have any suggestions for things that you encountered when you setup UI-View (for yourself or others) that I may mention on the Net Sunday night to help those trying to get UI-View installed, I would appreciate hearing about it. For some reason, many people are afraid to get on the net and ask questions, so a lot of what I do will have to be guessing what questions are out there unanswered.

For those of you that did not hear the Net Sunday night, I started a "tutorial" session for people who want to get involved in APRS, but are unsure of what steps to take. I intend to walk as many of them as possible down the path of setting up UI-View with an internet connection at first, then moving into a SoundCard interface, then discuss further options like TNC's.

The first step that I suggested for them on Sunday was to download and install UI-View32 from www.ui-view.org. This Sunday I plan to discuss initial setup of UI-View and help anyone with any problems that they encountered during the install.

BTW, I have suggested UI-View because 1) it's the most popular APRS program available today 2) it's free and 3) it's easy to use.

On Tue, January 3, 2006 5:41 pm, David Hoffman said:
> William, I like your idea of getting everyone to download and

1120. Update on KF4CFO-7

Yahoo group: EastTNAPRS
Date: 2006-01-04 00:36:45 UTC
From: Scott
Topic: 1120 Message: 1120

As of noon today, KF4CFO-7's beacon is now set to WIDE2-2 and nothing else. The digi is set according to the guidlines for UI-VIEW to do "trapping" of anything larger than threes, i.e. WIDE4-4, WIDE5-5, TN4-4, TN5-5, etc. It will digi on one WIDE or one RELAY, but only once. As the days go by, it will begin to be scaled back and become a WIDE1-1 or TN1-1 digi only. It will probably remain this way for stations local to it.

It also now responds to the r-command "?I" for local info.

As for my home station, which generally is on only during Skywarn, and usually on Internet connection, it will not have it's digi on at all, uless there is a request for it during a special even, such as a ballon launch or something. I do not have dedicated equipment for it, and probably won't have. My beacon, when on, is set at WIDE2-2. A lot of times I have UI-VIEW on in RX only mode.

If anyone sees anything else that needs to be changed, let us know. The main purpose for KF4CFO-7 sponsored by the McMinn Co Amateur Radio Club is as follows:

(1) To provide a fill-in digi between Knoxville and Chattanooga.
(2) To provide Skywarn data to monitoring stations.
(3) To provide position data for search and rescue and special events as needed.

1122. Idea on Skywarn Object posting

Yahoo group: EastTNAPRS
Date: 2006-01-04 01:19:28 UTC
From: Scott
Topic: 1122 Message: 1122

OK, here is what I have gleaned from what has been discussed with the folks at MRX:

(1) They want the objects to stay on screen for 1 hour.
(2) They want "near severe level" objects on screen.

Moe made the comment "This system is designed to be local coverage for MRX to see and question if need be."

With that in mind, here is something we might consider...direct path beacons.

For instance if WA4KJH-7 can hear Moe reliably, and WX4MRX can hear WA4KJH-7 reliably, then why not change the beacon during the time the objects are being sent to WA4KJH-7,WX4MRX-1 or maybe WIDE,WX4MRX-1. If the Igate is picking it up too much, then add RFONLY to the end, i.e. WA4KJH-7,WX4MRX-1,RFONLY.

For us down further south, we would work out a similar path. From my station, I might do ("no tried yet") KF4CFO-7,WA4KJH-7,WX4MRX-1,RFONLY.

This really shouldn't be a problem, because with a day or so of tinkering with the path to be sure what works, but once a good path is found, then put a strip of paper on your monitor with that path on it.

Like I have said before, this is a suggestion. I definitely don't have the answers.

I just tried a message and a ping to WX4MRX-1 using path "KF4CFO-7,WA4KJH-7,WX4MRX-1,RFONLY" and got an almost instantaneous reply back.

So, does it work?

Since you don't want WX4MRX-1 to digi the packet back out, it would be best to remove his call from the VIA path. The RFONLY will prevent your message from going INTO an IGate (and if it never goes it, it can't go out); If you are "local" to WA4RYW-1, then RFONLY should not be necessary.

Give it a try and let me know how these modifications work for you.

From: John Moyers
Topic: 1122 Message: 1127

Scott, Good points on the beacon's. Let me go one step further. If memory serves me correctly, I think KJH-7 will also respond to either TNWIDE or WIDETN.... You all can test that. Now since the MRX site can pretty much hear KJH-7 and MRX-1 direct, and if the Cleveland boys had a digi up on Bean Mtn it could hear that one too, this gets real simple and it's the way we did this with MRX about 5 years ago when I used to upload objects to the network. For local stations just use ONE DIGI in your beacon. Either KJH-7 or MRX-1, Actually if you are going to name them by call (recommended method for this) just put both calls in.

(Side Note to MOE..... If MRX-1 is going up on Holston MTN, tell Howard that I won't say a word if he needs to use the coax hanging from the hole in the wall on the south end of the porch behind their transmitter as long as it is being used for APRS. The antenna on it is cut a little short for 144 MHz, but it should load ok. This is a spare antenna I left in place in case it was needed for something important and related to my mission.)

Back to the regular program..... If you can't hit KJH-7 or MRX-1 direct then enter the required digi by callsign ONLY. NO ALIASES. Second, Stop the IGATEs from gating ANY internet traffic to the RF port, period. We don't need the QRM during significant events. If means you only run your IGATE when you are home and can manually control it. Then so be it. The point of all of this is to REDUCE the QRM on the Fq as much as possible. I don't care how much traffic the IGATEs send to the internet, we just don't need any internet traffic on the main operating channel during severe WX. The one exception to this would be Severe Wx bulletins from EMWIN for the affected region.

Why isn't the station at the NWS Morristown not running WX4MRX? Why is it running WX4MRX-1??? Reserve your ssid's for digi's Since MRX is the licensed control point then WX4MRX makes the most sense.

I forgot that WX4MRX-1 is the "addressee". Also, with the RFONLY not at the last of the path string, it begins to get "ping ponged" out of the Igates. Came out of WA4YYM's twice both times, and got re-digid twice more after that. (Don't know who, someone has a digi I can hear local to me that does not do alias sub.)

I agree 100% on all points John. I think direct path is the way to do it during Skywarn, and I also agree on the Igates killing everything except MRX, HTX, OHX, and SPC objects and messages. I personally believe it would really clean up the system during Skywarn.

As far as an APRS digi on Bean, it probably isn't going to happen. I think Joe's 2M & 70CM machines are probably the last things the Forest Svc will let up there.

Also, since WA4RYW has done all the mods to his Igate, his should be enough in the north area. Don, WA4YYM does OK down south. That should be enough. I had thought about running KF4CFO-7 as an Igate for WX objects and messages only, but I really don't believe it will be needed. It doesn't do any Igating at all now.

WA4YYM is trying to get your message to WX4MRX-1?

I would expect that WA4YYM hears your station either direct or via a single hop, so it should not be putting your packets back onto the local RF.

WA4YYM, can you elaborate on what may be happening?

IGates "should" only gate packets (messages) to local RF that are (1) from stations not on the local RF and (2) addressed specifically to a station on the local RF.

In my IGate I had defined local RF as stations I have heard direct or via AT MOST 1 hop away; I'm not sure how others have theirs setup nor how to even adjust this setting with UI-View.

With the different digi configurations in the area right now, it's hard to use one path to cover the entire area. For example, I will no longer hear KF4CFO-7 at my IGate because he's using a path of WIDE2-2. The path of WIDE2-2 is a good choice for him given the area that he would like to cover; if all of the big digi's supported WIDEn-N (specifically WIDE2-2), then I would hear KF4CFO-7 via RF and I would not send any of his packets back to RF.

Short of turning off ALL IGates in the area (except for one that can hear every "local" station), I don't know a solution to this issue...except getting all the digi's on the same page (hint, hint :->)

Does anyone else have any ideas?

Don, I think you're the only one in a position to explain why your IGate would have gated the messages in question to RF.

1137. Reducing unnecessary digipeates

Yahoo group: EastTNAPRS
Date: 2006-01-04 03:11:29 UTC
From: William McKeehan
Topic: 1137 Message: 1137

In an attempt to help reduce unnecessary packets on the local RF, home/fill-in digi's should remember that they can exclude stations from being digipeated; for example, my home station does not digi KA4TAR - why? He's much bigger than my little station and covers a larger area and does not need my help; the same is true for WA4KJH-7; I don't digi him either (for obvious reasons). I also do not digi my personal stations; sometimes this would help me, but if I hear my other stations, then WA4KJH-7 can generally hear me also.

You can easily do this in UI-View:

NOTE: Excluding Callsigns From Your Digi
If you want to stop your digi digipeating certain callsigns, then you can put them in the EXCLUDED key in the [DIGI_OPTIONS] section of UIVIEW32.INI. Put them all on one line, separated by commas.
E.g.EXCLUDED=G4IDE,G8MZX,MB7UAA
Don't put an SSID, the callsigns are excluded irrespective of what SSID is used.

So if your home digi is doing too much, turn it down...less unnecessary packets on RF improves the RF network.

From: Jeff Yawn
Topic: 1122 Message: 1138

Actually everyone using one path or very similar paths is part of the problem. If just 5 of us use the same path and 4 others digi that path and at least one digi has a unproto address to another digi then you can quickly see how many hops are involved. Since we have no good way, YET, to control the number of hops then it is the paths that need fixin'. I made an antenna change today so I can hit kjh directly. I changed my path to "aprs,wa4kjh-7" now my traffic will only go out 2 times. Once when I send it and once when kjh digi's it.

On another note, if you are chatting with someone who you can hit direct leave the digi out of the path since that doubles the traffic.

Also for home or fixed stations that have a "GOOD, CLEAN" route to a digi we should think about removing multiple alias's from the path.

Example a fixed station has "relay, wide2-2" in their path, the digi with the "relay" alias digi's then the "wide2-2" digi's then the next "wide2-1" digi's and now we have 3 hops when only 2 were needed. It is also possible that another digi on "relay" can make another hop if circumstances are right. Watch the data stream sometime and you can see what I mean.

Not picking out anyone or picking on anyone but k4cht-2 has a path of "wa4kjh-7,wide" . Depending on collisions and or traffic volume it makes 3 to 5 hops and actually gets digi'd by kjh twice. because of the unproto address of one of the other digi's. This is not the only one there are many and I was one until I fixed it.

We control the amount of dupes in our paths. Choose wisely and watch the stream to see exactly what your path is doing.

For the newer users by unproto address I mean that the DIGI can have another path it sends out when it digi's your aprs packet. This is used widely in the packet world to provide known paths to other nodes or digi's to further extend distance or other factors like BBS's or Gateways. I am not talking about the unproto path in station setup in UI View. This is really mislabeled in my mind and should have just been "path". An "unproto" address is generally something the node or digi adds to your packet without your knowing it unless you watch the data stream. For example if you only have wa4kjh-7 in your path then kjh will digi you but if kjh had n4neq-3 in it's unproto address then you will get digi'd again by n4neq-3 when you never put it's call in your path.

Just some more stuff to kick around.

Here is my rule of thumb to "see" if I can hit another station or particular digi direct. If I could talk simplex to the same location with an S-5 (half-scale) or better signal, then I can hit it direct. In McMinn Co just about everyone who is a ham can talk all the way across the county to any other station that way. And yes we do have the hills and mountians. That's why we teach our APRS stations to run WIDE2-2 in a home digi. Absolutlely no reason for home digi to run RELAY in their path. And I also agree with William on the principles in FCC 97 that we use no more than needed to establish communication. We each need to address this concept in path and power. If 10W at WIDE2-2 will do it for a home station, so be it.

Who is setting up the digi that's going on Clinch Mountain?

I REALLY think we need to get that person involved in the EastTNAPRS group and have a group of people help determine the best configuration for it.

I assume this will be a WIDE area digi and will work to move traffic from WA4KJH-7's area to the Bristol area.

My thoughts are:

1) start with the "new" style configuration
2) adjust the configuration to support aliases of RELAY and WIDE
3) adjust the beacons to alternate between LOCAL only beacons, via WIDE and via WIDE2-1
4) If the digi has coverage that is too good, you may consider lowering the HAAT or power or antenna gain or other things to prevent QRM.

I'm sure others with more experience than I will also have some thoughts.

With the network as it is today, I believe that most home stations only need a single digi in their beacon path. And, especially in the case where you can talk to multiple digi's, I would suggest that the path be via a specific digi.

Mobile stations may need 2 hops to take advantage of help from home stations (thus the traditional RELAY,WIDE).

In my case (KI4HDU-2), I use WA4KJH-7 and that's all. When I send messages, I will pick digi's that I think would be the best path to get the message delivered, often trying first with a single hop via WA4KJH-7.

Thoughts?

OK, You've lost me.

K4CHT-2 put's out a packet with a path of WA4KJH-7,WIDE. If someone other than WA4KJH-7 hears it direct, they will not digi the packet. Once WA4KJH-7 hears it, he will digi it out indicating that WA4KJH-7 is "used". The next step would be for every WIDE digi that hears WA4KJH-7 to digi the packet back out. WA4KJH-7 may hear the packet multiple times after that, but it should not digi it back out again - unless you have a path of WA4KJH-7,WIDE,WIDE.

Am I missing something?

From: Jeff Yawn
Topic: 1122 Message: 1144

UNLESS one of the other digi's has a generic alias our another digi as it's unproto address then it will go back to kjh again.

K4CHT-2>APTW01,WA4KJH-7*,WIDE:!3612.69N/08313.35W_> WXTrakII
K4CHT-2>APTW01,WA4KJH-7,N4NEQ-3*:!3612.69N/08313.35W_> WXTrakII
K4CHT-2>APTW01,RELAY,WA4KJH-7*:!3612.69N/08313.35W_> WXTrakII
first digi'd by kjh then by n4neq then again by kjh

Here is another example of something similar just not digi'd twice by the same digi.

WA4RYW-1>APJI23,RELAY,WIDE2-2:>East Tennessee APRS IGate EM75vu
WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-2:<IGATE,MSG_CNT=195,LOC_CNT=35
WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-2:>East Tennessee APRS IGate EM75vu
WA4RYW-1>APJI23,N4CQW-1*,WIDE2-2:<IGATE,MSG_CNT=195,LOC_CNT=35
WA4RYW-1>APJI23,N4CQW-1*,WIDE2-2:>East Tennessee APRS IGate EM75vu

Now if there is another digi that supports widen-n then there will be 2 more hops just from this one station unless it gets killed by a collision because there are 2 separate beacons that digi through n4cqw-1 the igate will get digi'd to wide 2-1 then his standard beacon will get digi'd to wide2-1. All from a path of "relay, wide 2-2".

Now this is not a real problem as the current network can support a few dupes for now but as it grows and as we start using it for SKYWARN and other things this will grow exponentially.

BTW I am not picking on these guys there may be a valid reason they have to run the path they do. I had to run relay, wide for a while just so my station could be seen on the map. But as more stations are added if they all use a generic path like "relay, wide" or "wa4kjh-7,wide2-2" THIS WILL GROW TO A BIG PROBLEM. Until we can get ALL the digi's on the new system for WideN-n the only control we have is to adjust our paths. Fixed stations should only be on one digi unless they need multiple hops to make it to the big digi.

My thoughts, take it for what it's worth.

Jeff, I'll have to agree with you. The generic "RELAY" and "WIDE" and even the "WIDEn-n" is really to find path. Once a station finds what works, they probably should go to a more directed path, and yes, I am guilty!

All from a path of "relay, wide 2-2".
>
> Now this is not a real problem as the current network can support a few dupes for now but as it grows and as we start using it for SKYWARN and other things this will grow exponentially.
>
> BTW I am not picking on these guys there may be a valid reason they have to run the path they do. I had to run relay, wide for a while just so my station could be seen on the map. But as more stations are added if they all use a generic path like "relay, wide" or "wa4kjh-7,wide2-2" THIS WILL GROW TO A BIG PROBLEM. Until we can get ALL the digi's on the new system for WideN-n the only control we have is to adjust our paths. Fixed stations should only be on one digi unless they need multiple hops to make it to the big digi.

From: William McKeehan
Topic: 1122 Message: 1146

Jeff,

Thanks for the clarification, I understand what you are seeing now.

My guess is the third packet in this list:

```
> K4CHT-2>APTW01,WA4KJH-7*,WIDE:!3612.69N/08313.35W_> WXTrakII
> K4CHT-2>APTW01,WA4KJH-7,N4NEQ-3*:!3612.69N/08313.35W_> WXTrakII
> K4CHT-2>APTW01,RELAY,WA4KJH-7*:!3612.69N/08313.35W_> WXTrakII
```

was first digi'd by some station that does not have alias substitution turned on. Either that or WA4KJH-7 is doing something strange.

BUT, in general, I think we are saying the same things:

1) Remove RELAY from your path unless you are a mobile station
2) use the shortest path possible for communications as long paths produce a large number of packets (not just one packet per hop, but one for each digi that hears the last hop)
3) use specific digi's in your path when appropriate to reduce QRM

Right?

They won't interfere with each other, and yes Ken had the other site. The big trick with digi's is in setting the timing parameters. I still think that WX4MRX without an SSID should be the identifier for the NWS. You have yet to address the reasoning behind the -1..... Guess it's time to call the NWS and see if Howard can explain the reasoning to me. I can see using an SSID on a portable, a mobile, or a digi, but never at the licensed control point. This is contrary to what has historically been acceptable operating practices on packet radio. So Moe, again why are they using the -1 SSID at the licensed control point??

Coverage from Clinch Mountain should give you Claiborne County, most of Union County, Hamblin Co, Greene Co, Cocke Co, Hawkins Co, and maybe the southern ends of Sullivan and Washington Co's. As for taking a load off of KJH-7? No it won't take any load off. It add more traffic to the local frequency depending on if you can hear MRX-7 direct and what MRX-7 can hear direct. Sounds like the path to Asheville is about to open back up.

Subject: Re: [EastTNAPRS] Re: Idea on Skywarn Object posting

Well, we will have a digi going up on Clinch Mountain, not Holston like I thought... brain fart must be all this RF flying around... The old BBS digi site... drawing a blank on who's it was, he is a SK now... want to say Ken maybe... anyway it's that old digi.

With 2 call signs on the air at the same time one will be the WX4MRX-1 (NWS) and the other will be WX4MRX-7 (DIGI).....correct? We are thinking of changing the path on this digi to something different to keep from killing KJH...both should have great coverage... this one should cover the Northern Counties pretty good.

What would happen if we set the new machine up to the new settings? What kind of havoc would this raise having the "old and the new" in the same area? Would that help take some of the load of KJH? We have not finished the set up on the digi yet so any changes could be made now and not too create much of a problem... like going up the mountain. Just a dumb question on trying top figure this stuff out... my famous statement now.... (Drum roll please).....GEEK or GREEK to me.

We are also thinking about what would happen if we lost KJH... what could or would take it's place till you have it repaired... no snakes intended. =)~ Where I am at seems to be a good location I seem to hear alot of stations but in no way could do everything that yours does... it would be almost insane to try to send anything ... that would fun to try one day... remove KJH out of any paths and see what happens... direct to direct.... interesting thought.

73 Good Night, Moe N4CQW

OK, You've lost me.

K4CHT-2 put's out a packet with a path of WA4KJH-7,WIDE. If someone other than WA4KJH-7 hears it direct, they will not digi the packet. Once WA4KJH-7 hears it, he will digi it out indicating that WA4KJH-7 is "used". The next step would be for every WIDE digi that hears WA4KJH-7 to digi the packet back out. WA4KJH-7 may hear the packet multiple times after that, but it should not digi it back out again - unless you have a path of WA4KJH-7,WIDE,WIDE.

Am I missing something?

No KJH-7 is doing just what it was designed to do. Digipeat the Relay of mobile stations that it hears with 'RELAY" as their first digi alias in their beacon string. Only mobiles and portables should EVER use RELAY, with a few exceptions, and once a reliable path is learned by the fixed station then relay should not be used.

That usually indicates a home station using RELAY as their alias
digi'd it but it didnt do callsign substitution.

From: Jeff Yawn
Topic: 1122 Message: 1153

Experiment. I changed my path to relay,wide these are the results

KF4UVT>APU25N,RELAY,WIDE:=3604.76N/08409.94W- {UIV32N} Heard direct no digi

KF4UVT>APU25N,WA4KJH-7*,WIDE:=3604.76N/08409.94W- {UIV32N} Digi'd by wa4kjh-7

KF4UVT>APU25N,RELAY*,WIDE:=3604.76N/08409.94W- {UIV32N} Digi'd by relay not sure where this comes from but I suspect someone is running a digi with either relay or wide in the unproto address that is added to my packet

KF4UVT>APU25N,RELAY,WA4KJH-7*:=3604.76N/08409.94W- {UIV32N} Digi'd by wa4kjh-7 again because of the "relay"

So yes WA4KJH-7 will digi the same packet 2 times if it is told to.

Now this is what happens when my path is set to "WA4KJH-7"

KF4UVT>APU25N,WA4KJH-7:=3604.76N/08409.94W- {UIV32N} Heard direct

KF4UVT>APU25N,WA4KJH-7*:=3604.76N/08409.94W- {UIV32N} Digi'd by WA4KJH-7

By just using 1 call in my path I eliminate half of my packets and since kjh-7 digi'd me I know I am on the map.

Moe, your not giving me heart burn. You have finally explained it, and if you did so in the last message then I overlooked it and apologize. The use of -1 as one of the control stations is correct, but I've normally only seen it used this way when you have 2 control stations on the same frequency. An example would be a personal use station and a BBS. In that instance the BBS would normally be -1 and the personal station would just be the callsign.

It's not a big rush on changing it, but here is why it is important. If you are new to the area and just looking at the Local APRS network and you see WX4MRX-1 you are normally going to think that this is just a DIGI. However if you see WX4MRX you will know that this is a control station, ok in MRX's normal use its monitoring is limited and the auto answer text handles this notification. But the callsign without an SSID does give you a little more information about the station at first glance. To most it probably doesn't seem like something as simple as an SSID would be important. But if you ever have to go into an unfamilar area and interface with a system, these little things can become very important in assessing the networks structure and what is what. Many times the first glance is all you have time to learn.

True, APRS does use Icon's to help you know what type of station it is but lets say all I have is a terminal program and a TNC. From watching the traffic on the air I can figure out that WX4MRX is the NWS station, if I have a WX Spot report I can send that in a UI message to WX4MRX and never see any of the icons. Call it the least common denominator method of APRS. It does work and has been used in the past.

You are also correct that these little things do bug me. I have seen these little things create to much chaos during real events to many times. As to whther or not you change the -1 or not really doesn't matter. What I really wanted to know and finally got an answer to was the WHY it was chosen in the first place. Now I know. The WHY was the most important part.

Thank You and get well soon. Pneumonia is not fun.

As far as the -1 goes trying to stick to what we thought was right when putting up 2 stations with same call sign... no other reasoning other than

that...so to have upset you about it... I thought I explained it in the last post I made but I guess not...

If it is going to give you heart burn we can forgot the whole thing... just trying to help.

AS SOON as I or someone else can get to the NWS it will removed. It may take me a few days I have pneumonia but I will get up there and change it.

Yes, and since you had already explained that I didn't readdress it. But the third is from a station with the alias of RELAY that doesn't do a callsign substitution for relay. This means that either the function is in the off setting or the TNC's firmware pre-dates this option. In either case it is an unknown digi. I really wish these had time stamps on them. That would give me a couple of more hints.

And Jeff just helped track down who is running RELAY without substitution. Jeff, which stations can hear you direct? Reduce your pwr to minimum and see if the RELAY still digipeats you without the substitution. Then do digi path's at this reduced pwr and see which stations can also digipeat based on their callsigns. Fox hunting by knowing where the fox isn't and pinging until it raises it's head, Fire for effect..... HI HI

Subject: Re: [EastTNAPRS] Re: Idea on Skywarn Object posting

Experiment. I changed my path to relay,wide these are the results

KF4UVT>APU25N,RELAY,WIDE:=3604.76N/08409.94W- {UIV32N} Heard direct no digi

KF4UVT>APU25N,WA4KJH-7*,WIDE:=3604.76N/08409.94W- {UIV32N} Digi'd by wa4kjh-7

KF4UVT>APU25N,RELAY*,WIDE:=3604.76N/08409.94W- {UIV32N} Digi'd by relay not sure where this comes from but I suspect someone is running a digi with either relay or wide in the unproto address that is added to my packet

KF4UVT>APU25N,RELAY,WA4KJH-7*:=3604.76N/08409.94W- {UIV32N} Digi'd by wa4kjh-7 again because of the "relay"

So yes WA4KJH-7 will digi the same packet 2 times if it is told to.

Now this is what happens when my path is set to "WA4KJH-7"

KF4UVT>APU25N,WA4KJH-7:=3604.76N/08409.94W- {UIV32N} Heard direct

KF4UVT>APU25N,WA4KJH-7*:=3604.76N/08409.94W- {UIV32N} Digi'd by WA4KJH-7

By just using 1 call in my path I eliminate half of my packets and since kjh-7 digi'd me I know I am on the map.

From: Jeff Yawn
Topic: 1122 Message: 1157

One other thing I forgot. IF you do check the data stream to see exactly what your station is putting out. You have to look at it over time. Just once or twice will not tell you the REAL story. Collisions do occur regularly that kill some packets. When I changed my path it took 4 or 5 beacons to really see what all is happening. Just like some of my previous examples do not happen all the time due to being lost in the maze of digital traffic. Since these (APRS) packets are UI packets or unconnected packets they do not get acknowledged and are only sent once per station beacon. Just as on voice "doubles" do happen and both packets are lost since there is no one to tell either of them they did not make it through.

From: WA4YYM@aol.com
Topic: 1158 Message: 1158

In a message dated 1/3/2006 9:32:14 PM Eastern Standard Time,
EastTNAPRS@yahoogroups.com writes:

WA4YYM is trying to get your message to WX4MRX-1?

I would expect that WA4YYM hears your station either direct or via a
single hop, so it should not be putting your packets back onto the
local RF.

WA4YYM, can you elaborate on what may be happening?

I don't know specifically what you are asking. My station, WA4YYM is set to
digi (alias) for my callsign, WA4YYM and WIDE1-1. I do have I have the
I-Gate set to gate RF to internet and gate local messages Internet to RF. I
regularly hear the Athens stations direct. There isn't much activity in
Chattanooga except for transient mobiles. The only other WIDE I hear regularly is
W4LAW-3 and occasionally WA4KJH-7. My I-Gate is active via DSL 24/7.

MessageClear on the left, clear on the right, clear down range,,,, OPEN FIRE. I thought about that earlier but have not had the time. I'll play with it this evening and tomorrow.

Stations I hear direct
K4HSM
N4CQW
N4NEQ-3
N4TJM-1
WA4KJH-7
WA4RYW-1 AND -7
WO5P

and since I know k4cht has the same symptoms if I get his list it will probably narrow it down further. I QRY his station with no answer.

1160. THE "COMMING SOON" NOPONE (KF4YMC-3) DIGIPEATER

Yahoo group: EastTNAPRS
Date: 2006-01-05 03:30:32 UTC
From: Kevin R. Colvin
Topic: 1160 Message: 1160

THE "COMMING SOON" NOPONE (KF4YMC-3) DIGIPEATER

First, a little background information.

A segment of John Moyers statement in a post replying to a post that I had posted.

"Some where over the last 10 years I had hoped several other good WIDEs would have been installed. Say one on Starr Mtn would be nice, or one over around Dayton or No Pone Mtn. Low level WIDEs, like KF4CFO-7, are great provided the hams in that area put up enough digi's to cover the area."

Quoted from post on E TN APRS Yahoo group Wednesday, November 02, 2005 1:10 PM

I had posted several posts and John has always been kind enough to reply to most. This particular phrase got my brain unstuck and put into motion. I thought, ok, if John thinks this area needs a better digi, then so be it and I started sending e-mails to see if we could get one put up.

I offered to buy a new KPC3+ (ver9.1) to get the ball rolling and asked for assistance on other things it would need.
Scott, NA4IT, having many contacts and knowing more than I did about APRS took over a lot of the doings. Several area hams offered to help, and since the McMinn club was putting up a new 440mhz machine, and a remote receiver for another machine at No Pone, Scott was able to secure a place for the APRS equipment in the mini-cabinet that will be placed at No Pone.

Things started to fall into place, a radio was purchased, antenna purchased, coax donated. The digi was set up and op-checked for several days at another location. All systems were a go.

I also sent e-mails to most area wide digi owners, I did not send one to John, could not find an e-mail address, and also because it was one of his hopes. (And I know john will contact me if he has something to tell me or a suggestion a to how to improve the overall system.) Some of the e-mails to wide area digi owners bounced. But we did try to let other area wide owners know. No response from any of them yet.

Several operators had run packet nodes for years from this site and all agreed that this is a good site for a digi.
It primarily is to cover Meigs and McMinn counties. It also should provide a stable link between the Chattanooga area and Cove Mt. digi's if needed. NT4UX-2 in middle TN may also be heard at times, but all things point toward it not being a stable link. N4NEQ-3 is also not considered a stable link at this time, partially because the No Pone digi antenna will be about 20ft above ground level. This should reduce it from hearing too much. Also, other antennas being installed need the separation from the APRS antenna to keep down intermod and are being place higher up the tower.

Discussion on what alias to support had been kicked around. The original plans were to support RELAY, WIDE, TN, WIDEn-n, & TNn-n. But after further debate and learning that W4LAW-3 is supporting (at least) some WIDEn-n's, and that John has future plans to upgrade the WA4KJH-7 machine to the new paradigms, the alias setting were changed. The No Pone digi will be set to support the new paradigms only, trapping WIDE4-4, WIDE5-5, etc.

Now as far as to when it will be put into operation.

We had planned to have it up by January 15th, but since the unit is to be housed with other equipment that is still being fine tuned, and other equipment that is on order and due to be in late January. So it is going to take a little longer. Also, waiting on the other equipment affords the tower crew on climb to install all antennas. At the time No Pone goes on the air, KF4CFO-7 will no longer be a WIDE digi, but will become a true EOC / Club Shack station, and only digi WIDE1-1 and it's own callsign. The true effectiveness of this digi will not be seen until it is up on-air. But preliminary planning shows it to be able to fulfill the needs of McMinn and Meigs counties and provide a vital link between the Northern and Southern area of E TN.

Again, I'm green on all this, and a lot of what has been discussed flew over me like the last balloon launch (images and movies at http://balloon.utarc.org/UX-5/ke4fgw)...

Apparently, some of the unnecessary traffic is also the effect of DIGIs sending acknowledgements back to the originating station, or at least attempting to.

What if all you want to do is DIGI the information/wx report objects and not get an ack back? Would a command such as WIDE 2-0 work? If acks attempting to be sent back cause unnecessary traffic, then can we set up the digipeaters to just bounce the message out on RF without sending an acknowledgement back to the mothership?

Example: Say we want to send an object report to KJH, and at least get somehting through to Chattanooga or to Tri Cities, but the acknowledgements are whats clogging the airwaves. Is there a WIDE command that will tell the DIGI not to send a respone back as it is not necessary?

Along the same lines, can we not set up our stations to only send the packet ONCE, whther an ack was received or not? Can we set up the programs we use to send the objects out only once with no acks?

Thanks for your time.

Greg, K4HSM (ack).

Greg,

Objects don't get "acks". The are simply a map object that appears
after transmission.

Messages to a station (sent from the message screen) do get "acks"
from the sent-to station if that station gets the message.

Keep in mind that you may not be hearing the mystery digi direct, but he is hearing you and K4CHT-2 direct.

And it looks like K4CHT-2 is using a WXTrackII - a transmit only device, so he probably will not get any messages you send to him.

Topic: 1122 Message: 1164

I agree with Scott's response and would add that if you use WIDE2-0, no digi will digi your packet, so it will only be seen by those who hear you direct.

To have an object seen in the Knoxville area, use a path of WA4KJH-7; to have it seen in Knoxville and Chattanooga, use WA4KJH-7,W4LAW-3; to have it seen in Knoxville and the Tri-Cities...I'm not sure maybe WA4KJH-7, W4FXO-3 (I'm not sure if W4FXO-3 hears WA4KJH-7).

Topic: 1158 Message: 1166

It is the IGate portion of your configuration that I was wondering about.

For some reason, when NA4IT tried to send a message to WX4MRX, your IGate put that packet onto RF from the internet.

My guess as to why this happened was that your station had not heard NA4IT's station within a certain amount of time (the time amount depends on how UI-View is setup and I do not know if this is configurable), but it had heard WX4MRX-1.

Knowing nothing about your setup, I thought you may have some more ideas as to why this is happening. I have since done some reading about UI-View's IGate functionality and have a little bit better understanding of how it works; maybe you could post your IGATE.INI file here for us to have a look at and see if we notice anything.

NOTE: I am not asking you to stop what you are doing...I'm just looking to better understand how your IGate (and UI-View IGates in general) work.

Travis writes:
I'd like to make one observation here. I have learned an incredible amount from this list. One of the things I have learned is that there is an incredible amount of knowledge on this list, not only in the world of APRS but also in being tactful. William, although I do not know him well, always attempts to show an incredible amount of humility as well as always being non-assuming about someone else's skill level in APRS.

However, I think it's silly to see people have to walk on eggshells at times. Now I know Don (WA4YYM) from the balloon chases and I know that William doesn't have to walk on eggshells with Don, as Don is as easy going as they come. However, from reading these posts lately, it seems as if there are some who are looking to take any statement on this list as a personal attack against them, their equipment, their operating procedures, etc. All I want to say is, lighten up! :-) Let's not take ourselves so seriously. We do not need to feel compelled to write a NOTE: at the end of a message in order to prevent someone from taking things the wrong way.

William leads the way here in tact and when he asks a question regarding our setup or paths or whatever, let's work on things to make things better. I'm hardly even active right now on APRS outside of my mobile and the digi, but I check these messages daily because of their content. (BTW William, I haven't forgotten about your email about the digi, reply is coming).

If you read a message and feel like the person who wrote it could mean one of two things by it, choose to accept that they meant the way that would least offend you. We're grown ups and let's learn from all of this. No taking our stations off the air just because of an email or a comment from someone.

William, thanks for your diplomacy on this list, but I'd rather see you be able to spend that extra time writing about APRS :-) Don (WA4YYM), none of this was in ANY way directed at you and neither you nor any reply you would have sent already would be the cause of my writing this, I just think it's gotten a little fragile around here lately.

Let's have fun & learn.

Stepping off soapbox now.

73s,
Travis N4TJM

Greg, there are no ack's for station or object beacons. The only time a ack is used on APRS is if you send a message to someone or a query to someone. Just the standard beacons that put everyone on the map do not get ack'ed.

Again, I'm green on all this, and a lot of what has been discussed flew over me like the last balloon launch (images and movies at http://balloon.utarc.org/UX-5/ke4fgw)...

Apparently, some of the unnecessary traffic is also the effect of DIGIs sending acknowledgements back to the originating station, or at least attempting to.

What if all you want to do is DIGI the information/wx report objects and not get an ack back? Would a command such as WIDE 2-0 work? If acks attempting to be sent back cause unnecessary traffic, then can we set up the digipeaters to just bounce the message out on RF without sending an acknowledgement back to the mothership?

Example: Say we want to send an object report to KJH, and at least get somehting through to Chattanooga or to Tri Cities, but the acknowledgements are whats clogging the airwaves. Is there a WIDE command that will tell the DIGI not to send a respone back as it is not necessary?

Along the same lines, can we not set up our stations to only send the packet ONCE, whther an ack was received or not? Can we set up the programs we use to send the objects out only once with no acks?

Thanks for your time.

Greg, K4HSM (ack).

Topic: 1158 Message: 1170

Thanks for the kind words Travis.

I am always trying to improve the APRS network in East TN - it's my goal to see us have a network that we can really use for events and emergency management. As many on this list know, I've only been involved in APRS for about 15 months, so I'm by far not an expert. When I discuss things on this list (and several others), I'm looking to learn - that's why I often question why. I will also give my opinion freely in the hops that if I am wrong that someone will correct me.

I've only met Don once and he seemed nice enough, but I wanted to be sure he did not confuse what I was saying as a request for him to take down his IGate/Digi because I think it has been a great addition to the area that he serves.

I guess that note more than anything was in my mind because of some discussions on some other groups that I've been involved in recently where things have got rather heated - I wanted to make sure to avoid that.

AND FOR THE RECORD

If you disagree with something I say in this group, please feel free to tell me I'm wrong; I'll probably argue with you about it, but that's just me learning :->

Also, if anyone on this list ever sees my station doing something it should not, please, please, let me know about it - some of you will even give me a call to let me know when I'm on the wrong frequency and I really appreciate that :-)

Back to APRS...

I have played with this this evening and the "relay" digi does hear me direct on 5 watts. I have it narrowed down to one of 2. But there is another possibility. Roy mentioned this evening while we were chatting, the digi in question may not be on the map and not send a beacon, but may still digi. The only way to know for sure is ask the owners of the 2 I think it could be, to turn them off for a bit then run the test again. Neither respond to aprsd nor does k4cht since he is WX only so no way to narrow it any further with out the cooperation of the owners.

I'll contact them quietly in person to ask for their help.

Keep in mind that you may not be hearing the mystery digi direct,
but he is hearing you and K4CHT-2 direct.

And it looks like K4CHT-2 is using a WXTrackII - a transmit only
device, so he probably will not get any messages you send to him.

After all of the discussions this past week, I think there are a few things that we can all agree on as good recommendations for APRS stations in our area.

1 - Home stations should not use RELAY in their path.
2 - Beacon paths of one or, at most, two hops is generally sufficient.
3 - Using the callsign of specific DIGI in place of a generic alias (WIDE) is more efficient.
4 - Messages should be routed via specific digi's to get to the target station.
5 - Aliases can be used to determine the most appropriate digi's to use to communicate with other stations.
6 - Home fill-in digi's should only respond to RELAY and WIDE1-1.
7 - Mobiles are encouraged to use RELAY or WIDE1-1 as the first hop in their path to use the home fill-in digi's.

Anyone disagree?

Topic: 1174 Message: 1176

I agree 100%. Below is a quote from webpage http://www.aprs.net/vm/digipath.htm entitled "APRS New User Path Information":

"DIGI PATH DO'S AND DON'TS:
* DO use a WIDE over a RELAY if you can work one directly
* DO make yourself a RELAY if you can work a WIDE directly and no one close to you is doing the same.
* DO check your DIGI or PROTOPATH lists to see what stations you can work directly
* DO use actual callsigns if appropriate, especially if you can see more than one RELAY but not a WIDE. Example path: N2XYZ,WIDE,WIDE
NOTE: Do not do this if the first station (N2XYZ here) is a WIDE! That is the same as WIDE,WIDE,WIDE! (see below)

DON'T use any of the following paths:
* WIDE,WIDE,WIDE: After the second WIDE transmits your packet, the first one will pick it up and retransmit it a second time. This snowballs and causes lots of wasted bandwidth.
* WIDE,RELAY: Causes ALL home RELAY stations to retransmit your packets.
* GATE: GATEs should never be used from VHF to HF - this will have reeeal bad implications for the HF net (perhaps even crippling the entire net). The 300 baud traffic of HF should pose no problem on the VHF 1200 baud net, but the reverse is certainly not true.
* DON'T put up a WIDE unless you truly have wide coverage and there are no other WIDEs in your area, and unless you plan to let it run 24 hours a day.

DON'T take all of these as gospel. Circumstances vary from location to location and you may need to bend or break these rules-of-thumb in your area. But DO check with your APRS neighbors first!"

William,

Why don't you take what you posted, and the quotes I posted, combine them, toss out the bad, keep the good, twaek it for E TN, and do it as a text file and place it in out files section as "PATH GUIDELINES FOR E TN APRS USERS"? Might even be good to put in it a listing of klnown WIDE digis and Igates in E TN.

1181. Re: Idea on Skywarn Object posting

Yahoo group: EastTNAPRS
Date: 2006-01-05 22:46:02 UTC
From: William McKeehan
Topic: 1122 Message: 1181

I've been thinking about this post since I first read it yesterday evening.

At first I was going to respond and disagree with you and say that the "old" method of using SSID's to identify station type is no longer used. This is a true statement; in APRS, this was the original method to identify the station type (and thus icon), but that has been replaced by a variety of methods today.

However, the more I think about it, the more sense your post makes to me.

With the internet used to expand APRS, you can communicate with someone that you do not see on your local display (assuming you are only operating on RF). All you need to know is their callsign and SSID. If you don't see them, it's hard to determine their SSID. So how do you send a message to these people that you suspect (or know) are APRS active? You try sending to their callsign only. Given this logic, I'm changing the configuration of my laptop station from KI4HDU-7 to simply KI4HDU.

After making that decision, I was trying to remember why I was using -7 on my laptop in the first place. I remembered it was because I used it primarily connected to my TM-D700. In the good-old days, the -7 was used to indicate a TM-D700 (or TH-D7) because these were mobile stations that could receive messages as well as send them (as opposed to some other transmit only stations). So with that, I'm going to change my TH-D7 from KI4HDU-6 to KI4HDU-7.

That leaves me with my IGate (-2 seems appropriate for that station) and my D700. Given that my TH-D7 will be used much more often than the D700, I think I will leave it as -14. -14 was traditionally used for truckers and I hope to have a little truck one day soon and hope to have the D700 in that truck, so that seems appropriate to me.

I still have my home station running -3 but I have eliminated the need to use it to send the "NET" bulletins and -3 is now in listen only mode, so you'll not see it on the air any more.

I was using a page on Bob, WB4APR's, web site as a reference:
http://web.usna.navy.mil/~bruninga/aprs/SSIDs.txt

Does this configuration make sense? If you are an old packet user that knows abut SSID's, would you assume that KI4HDU is a person at a station and KI4HDU-7 is a Kenwood?

Yes one would assume that KI4HDU is a person but I would have assumed the KI4HDU-3 was your mailbox and KI4HDU-7 was your packet node. Back in the day as my son calls it, when packet was popular the new Kenwood's had not even been dreamed of yet. The POPULAR Kenwood of the day was the tr-7950. look that one up on the internet, and yes I have one with a PK-232 TNC (first version not the new and improved 232MBX) .

Not a real fancy radio but it has the sweetest output audio you have ever heard in your life.

Just more useless info for you to digest.

1186. WA4YYM digi/IGate

Yahoo group: EastTNAPRS
Date: 2006-01-06 02:26:43 UTC
From: WA4YYM@aol.com
Topic: 1186 Message: 1186

Here is my igate.ini file. I think it is all default values.

73,
Don

```
;Lines starting with ';' are ignored.
;
[SETUP]
;GATE_ALL_PORTS specifies the ports on which to output
;traffic from the stations you put in [INET_TO_RF] below.
;Separate multiple ports with commas. E.g. 1,2,3.
;
GATE_ALL_PORTS=1
;
;USE_DEFAULT_PATHS - If this is checked, then traffic
;output on GATE_ALL_PORTS is sent via the default unproto
;paths for those ports as configured in Station Setup.
;If it is not checked, then the unproto paths specified
;in GATE_ALL_PATHS are used.
;
USE_DEFAULT_PATHS=True
;
;GATE_ALL_PATHS - see USE_DEFAULT_PATHS above. If you
;specify more than one port in GATE_ALL_PORTS, then you
;can specify a different path for each port. You separate
;multiple paths with '|' (pipe) characters. E.g.
;RELAY,WIDE|WIDE3-3|WIDE,WIDE. Please note - The path does
;not include the destination address, because the
;destination address for gated traffic is always the
;address configured in the UI-View32 'APRS Compatibility'
;dialogue.
;
GATE_ALL_PATHS=""
;
;MAX_DIGIS_FOR_LOCAL specifies how many digis a frame
;can pass through and the sender still be regarded as a
;local station. The default of 0 means that only
;stations heard direct are regarded as local. You can
;effectively disable the checking by putting any number
;greater than eight, because no AX25 frame should ever
;pass through more than eight digis.
;
MAX_DIGIS_FOR_LOCAL=0
;
;NOGATE - If a frame has any of the digi aliases
```

```
;specified by NOGATE in its unproto path, then a UI-View
;IGATE will not pass it to the internet servers. This
;provides a mechanism for APRS users to stop their frames
;being gated to the internet via your IGATE.
;
NOGATE=NOGATE,RFONLY

;SHOW_INET_ENTRY_POINT_CALLSIGN - If this option is set
;to TRUE, then the IGATE's callsign is inserted in all
;frames passed to the internet servers. It is inserted
;as an extra digi, and is suffixed with the text specified
;in INET_ENTRY_POINT_TAG. Note - this option can be set
;via 'Insert station callsign' in the 'APRS Server Setup'
dialogue.
;
;An example:-
;G4IDE's IGATE hears this frame:-
; G8MZX>APRS,RELAY,WIDE*:>Some text
;
;If SHOW_INET_ENTRY_POINT_CALLSIGN is set to TRUE, the
;frame header is altered before the frame is passed to
;an internet server:-
; G8MZX>APRS,RELAY,WIDE*,G4IDE,I:>Some text
;(The 'I' is a symbolic digi address for the internet.)
;
;INET_ENTRY_POINT_TAG is made editable, because exactly
;how this feature should work is still being discussed by
;the various APRS authors.
;
SHOW_INET_ENTRY_POINT_CALLSIGN=FALSE
INET_ENTRY_POINT_TAG=,I
;
;GATE_LAN_TO_INET - If UI-View32 is being used as a local
;server, and it is also connected to an internet server,
;then setting GATE_LAN_TO_INET=TRUE allows traffic heard
;on the LAN to be gated to the internet. NOTE - unless
;you are sure you understand what this means, then keep
;the default setting of FALSE!
;
GATE_LAN_TO_INET=FALSE
;
;GATE_ALL_RF_TO_INET - By default UI-View32 only gates
;APRS packets from RF to the internet, and it does not
;not gate digipeated copies of packets heard direct.
;If you check this option then -
; 1. Non-APRS frames are gated.
; 2. Digipeated copies of packets heard direct,
; including your own packets, are gated.
;This option is designed to be used when an IGATE is on a
;satellite RF frequency. It is recommended that you do not
```

```
;select this option for a normal IGATE.
;
GATE_ALL_RF_TO_INET=FALSE
OVERRIDE_TCPXX=FALSE
RECEIVED_TCPXX_WARNING=FALSE
EXCLUDED=""

[CONVERT_PNTS]
;The following determine whether $PNTS format posits (used
;in Japan) are converted to APRS format when they are gated.
INET_TO_RF=FALSE
RF_TO_INET=FALSE

[INET_TO_RF]
;In this section you can specify callsigns that will
;have all their traffic gated, callsigns that will have
;their position beacons but not messages gated,
;callsigns that will never have any traffic gated,
;object names that will be gated, and destination addresses
;that will be gated.
;
;You can use '*' to mean anything, so "G4*" means any
;callsign starting with "G4". NOTE - use this feature
;with caution, or you may generate an awful lot of
;traffic on RF!
;
;The order of callsigns in the list is significant.
;When checking a callsign against the list, UI-View32
;starts at the top, and stops as soon as a match is found.
;G4IDE would match against both G4IDE = ALL and G4* = NONE,
;and which came first in the list would obviously make a
;difference whether traffic from G4IDE was gated.
;In general, entries for specific callsigns should be
;put before entries with wildcards.
;
;Examples:-
;G4IDE=ALL means gate all traffic from G4IDE.
;G8MZX=NONE means gate no traffic from G8MZX.
;G4GZL=BEACONS means gate beacons but not messages
; from G4GZL.
;G4*=ALL means gate all traffic from callsigns
; starting with "G4".
;ABC*=OBJECT means gate objects with names starting
; with "ABC".
;SPECIAL=DEST means gate all traffic with a destination
; address of SPECIAL.
;
;A 'super-user' feature - You can specify a port and path
;for an entry by putting it on the end of the entry. This
;overrides the settings of GATE_ALL_PORTS, GATE_ALL_PATHS
;and USE_DEFAULT_PATHS.
```

```
;Example -
;G4IDE=ALL,1,RELAY,WIDE means gate all traffic from G4IDE
; on port 1, using an unproto path
; of RELAY,WIDE.
;You can, if you wish, omit the port, in which case the
;ports specified in GATE_ALL_PORTS are used.

[INET_TO_RF_LIMITS]
;In this section you can specify limits for the number
;of frames that your system will gate from the internet
;to RF. The idea is that it will stop your system
;hogging the RF channel.
;
;You specify the maximum number of frames that will
;ever be gated in a one minute, two minute and three
;minute period. Once any of these numbers are exceeded,
;frames are discarded until the rate drops back below
;the limit. The default values allow a short term peak,
;but a lower rate over a longer period.
;
;PLEASE NOTE - The capacity of a 1200 baud RF channel
;is around 30 frames a minute (obviously it depends on
;frame length, TXD settings, etc). To gate 6 frames in
;a minute means that you are taking up around 20% of
;the channel capacity, and that's not allowing for your
;frames being digipeated! So before you increase these
;numbers, please bear in mind that many APRS experts
;would say that the defaults are too high. You should
;always try to use values that are appropriate for
;local conditions.
;
;If you wish to disable the limits, you can put a '0'
;for all three values, but PLEASE don't disable the
;limits without first thinking very carefully about
;what you are doing and why you are doing it!
;
;The first three values apply to frames other than
;messages to local stations - i.e. frames that are
;gated as a result of entries in the [INET_TO_RF]
;section of this file.
;
ONE_MINUTE=6
TWO_MINUTES=9
THREE_MINUTES=12
;
;The next three values apply to messages to local
;stations. (A local station is one that your system has
;heard on RF.) These limits are really only guarding
;against abuse, and so can be more generous.
```

```
LOCAL_MESSAGE_ONE_MINUTE=8
LOCAL_MESSAGE_TWO_MINUTES=12
LOCAL_MESSAGE_THREE_MINUTES=16
;
```

1187. Re: [EastTNAPRS] Re: Idea on Skywarn Object posting

From: Jeff Yawn
Topic: 1122 Message: 1187

Computer generated facsimile I-gated by the internet to RF to shock and amaze us. Or maybe to make us believe the Matrix is not a computer generated dream world and we are all REAL.

Jeff

Which is exactly why I was originally going to disagree with John's note about -1 being used as a digi. It seems as though the purpose of the SSID's has changed greatly over the years and are now, in general, just numbers for people with multiple stations.

I do, however, see value in having one's primary human operated station set to just their callsign.

1190. Re: Idea on Skywarn Object posting

Yahoo group: EastTNAPRS
Date: 2006-01-06 14:26:49 UTC
From: William McKeehan
Topic: 1122 Message: 1190

So my idea of the good-old days is last year...my how time flies!

I looked at the APRS specifications which are dated August 2000; they agree with you, -7 is for an aircraft. So I'm not sure when the -7 changed to be a Kenwood radio...maybe it was just one man's idea.

>In the good-old days, the -7 was used to indicate
> a TM-D700 (or TH-D7) because these were mobile
> stations that could receive messages as well as
> send them (as opposed to some other transmit
> only stations).

In the good old days, I don't recall seeing TH-D7s or TM-D700s. That wasn't what the 7 was for back then. I'll have to find my list from way back then.

David Hoffman - KE4FGW

It was for an aircraft

David Hoffman - KE4FGW

1191. Re: WA4YYM digi/IGate

Yahoo group: EastTNAPRS
Date: 2006-01-06 14:43:08 UTC
From: William McKeehan
Topic: 1186 Message: 1191

Thank you Don for sharing your setting with me, but this makes me even more confused than I was before.

The way I read this section:
;MAX_DIGIS_FOR_LOCAL specifies how many digis a frame
;can pass through and the sender still be regarded as a
;local station. The default of 0 means that only
;stations heard direct are regarded as local. You can
;effectively disable the checking by putting any number
;greater than eight, because no AX25 frame should ever
;pass through more than eight digis.
;
MAX_DIGIS_FOR_LOCAL=0

is that WA4YYM should only gate messages from the internet to RF for stations that WA4YYM has heard direct. Looking at messages from WA4YYM over the past little while, I see that he sees these stations direct:
KC5ZJO-1
KE4IQS
KF4CFO-7
KF4YMC-1
N4CQW-1
W4KCO
W4LAW-3
W4LAW-5
W4OZK-7
WA4YYM-9
WB8ELK-12

This list goes back to before Christmas. I never see WX4MRX in his direct list.

You guys that have used UI-View more than I have; do you have any ideas why WA4YYM might have been gating the message from NA4IT to WX4MRX ?

I'm at a total loss to understand why it may have happened.

-------- Subject: [EastTNAPRS] WA4YYM digi/IGate
From: WA4YYM@...
Date: Thu, January 5, 2006 9:26 pm
To: EastTNAPRS@yahoogroups.com

Here is my igate.ini file. I think it is all default values.

73,
Don

```
;Lines starting with ';' are ignored.
;
[SETUP]
;GATE_ALL_PORTS specifies the ports on which to output
;traffic from the stations you put in [INET_TO_RF] below.
;Separate multiple ports with commas. E.g. 1,2,3.
;
GATE_ALL_PORTS=1
;
;USE_DEFAULT_PATHS - If this is checked, then traffic
;output on GATE_ALL_PORTS is sent via the default unproto
;paths for those ports as configured in Station Setup.
;If it is not checked, then the unproto paths specified
;in GATE_ALL_PATHS are used.
;
USE_DEFAULT_PATHS=True
;
;GATE_ALL_PATHS - see USE_DEFAULT_PATHS above. If you
;specify more than one port in GATE_ALL_PORTS, then you
;can specify a different path for each port. You separate
;multiple paths with '|' (pipe) characters. E.g.
;RELAY,WIDE|WIDE3-3|WIDE,WIDE. Please note - The path does
;not include the destination address, because the
;destination address for gated traffic is always the
;address configured in the UI-View32 'APRS Compatibility'
;dialogue.
;
GATE_ALL_PATHS=""
;
;MAX_DIGIS_FOR_LOCAL specifies how many digis a frame
;can pass through and the sender still be regarded as a
;local station. The default of 0 means that only
;stations heard direct are regarded as local. You can
;effectively disable the checking by putting any number
;greater than eight, because no AX25 frame should ever
;pass through more than eight digis.
;
MAX_DIGIS_FOR_LOCAL=0
;
;NOGATE - If a frame has any of the digi aliases
;specified by NOGATE in its unproto path, then a UI-View
;IGATE will not pass it to the internet servers. This
;provides a mechanism for APRS users to stop their frames
;being gated to the internet via your IGATE.
;
NOGATE=NOGATE,RFONLY
```

```
;SHOW_INET_ENTRY_POINT_CALLSIGN - If this option is set
;to TRUE, then the IGATE's callsign is inserted in all
;frames passed to the internet servers. It is inserted
;as an extra digi, and is suffixed with the text specified
;in INET_ENTRY_POINT_TAG. Note - this option can be set
;via 'Insert station callsign' in the 'APRS Server Setup'
dialogue.
;
;An example:-
;G4IDE's IGATE hears this frame:-
; G8MZX>APRS,RELAY,WIDE*:>Some text
;
;If SHOW_INET_ENTRY_POINT_CALLSIGN is set to TRUE, the
;frame header is altered before the frame is passed to
;an internet server:-
; G8MZX>APRS,RELAY,WIDE*,G4IDE,I:>Some text
;(The 'I' is a symbolic digi address for the internet.)
;
;INET_ENTRY_POINT_TAG is made editable, because exactly
;how this feature should work is still being discussed by
;the various APRS authors.
;
SHOW_INET_ENTRY_POINT_CALLSIGN=FALSE
INET_ENTRY_POINT_TAG=,I
;
;GATE_LAN_TO_INET - If UI-View32 is being used as a local
;server, and it is also connected to an internet server,
;then setting GATE_LAN_TO_INET=TRUE allows traffic heard
;on the LAN to be gated to the internet. NOTE - unless
;you are sure you understand what this means, then keep
;the default setting of FALSE!
;
GATE_LAN_TO_INET=FALSE
;
;GATE_ALL_RF_TO_INET - By default UI-View32 only gates
;APRS packets from RF to the internet, and it does not
;not gate digipeated copies of packets heard direct.
;If you check this option then -
; 1. Non-APRS frames are gated.
; 2. Digipeated copies of packets heard direct,
; including your own packets, are gated.
;This option is designed to be used when an IGATE is on a
;satellite RF frequency. It is recommended that you do not
;select this option for a normal IGATE.
;
GATE_ALL_RF_TO_INET=FALSE
OVERRIDE_TCPXX=FALSE
RECEIVED_TCPXX_WARNING=FALSE
EXCLUDED=""
```

```
[CONVERT_PNTS]
;The following determine whether $PNTS format posits (used
;in Japan) are converted to APRS format when they are gated.
INET_TO_RF=FALSE
RF_TO_INET=FALSE

[INET_TO_RF]
;In this section you can specify callsigns that will
;have all their traffic gated, callsigns that will have
;their position beacons but not messages gated,
;callsigns that will never have any traffic gated,
;object names that will be gated, and destination addresses
;that will be gated.
;
;You can use '*' to mean anything, so "G4*" means any
;callsign starting with "G4". NOTE - use this feature
;with caution, or you may generate an awful lot of
;traffic on RF!
;
;The order of callsigns in the list is significant.
;When checking a callsign against the list, UI-View32
;starts at the top, and stops as soon as a match is found.
;G4IDE would match against both G4IDE = ALL and G4* = NONE,
;and which came first in the list would obviously make a
;difference whether traffic from G4IDE was gated.
;In general, entries for specific callsigns should be
;put before entries with wildcards.
;
;Examples:-
;G4IDE=ALL means gate all traffic from G4IDE.
;G8MZX=NONE means gate no traffic from G8MZX.
;G4GZL=BEACONS means gate beacons but not messages
; from G4GZL.
;G4*=ALL means gate all traffic from callsigns
; starting with "G4".
;ABC*=OBJECT means gate objects with names starting
; with "ABC".
;SPECIAL=DEST means gate all traffic with a destination
; address of SPECIAL.
;
;A 'super-user' feature - You can specify a port and path
;for an entry by putting it on the end of the entry. This
;overrides the settings of GATE_ALL_PORTS, GATE_ALL_PATHS
;and USE_DEFAULT_PATHS.
;Example -
;G4IDE=ALL,1,RELAY,WIDE means gate all traffic from G4IDE
; on port 1, using an unproto path
; of RELAY,WIDE.
;You can, if you wish, omit the port, in which case the
;ports specified in GATE_ALL_PORTS are used.
```

```
[INET_TO_RF_LIMITS]
;In this section you can specify limits for the number
;of frames that your system will gate from the internet
;to RF. The idea is that it will stop your system
;hogging the RF channel.
;
;You specify the maximum number of frames that will
;ever be gated in a one minute, two minute and three
;minute period. Once any of these numbers are exceeded,
;frames are discarded until the rate drops back below
;the limit. The default values allow a short term peak,
;but a lower rate over a longer period.
;
;PLEASE NOTE - The capacity of a 1200 baud RF channel
;is around 30 frames a minute (obviously it depends on
;frame length, TXD settings, etc). To gate 6 frames in
;a minute means that you are taking up around 20% of
;the channel capacity, and that's not allowing for your
;frames being digipeated! So before you increase these
;numbers, please bear in mind that many APRS experts
;would say that the defaults are too high. You should
;always try to use values that are appropriate for
;local conditions.
;
;If you wish to disable the limits, you can put a '0'
;for all three values, but PLEASE don't disable the
;limits without first thinking very carefully about
;what you are doing and why you are doing it!
;
;The first three values apply to frames other than
;messages to local stations - i.e. frames that are
;gated as a result of entries in the [INET_TO_RF]
;section of this file.
;
ONE_MINUTE=6
TWO_MINUTES=9
THREE_MINUTES=12
;
;The next three values apply to messages to local
;stations. (A local station is one that your system has
;heard on RF.) These limits are really only guarding
;against abuse, and so can be more generous.

LOCAL_MESSAGE_ONE_MINUTE=8
LOCAL_MESSAGE_TWO_MINUTES=12
LOCAL_MESSAGE_THREE_MINUTES=16
;
```

1192. TO USE A CALL SUFFIX OR NOT

Yahoo group: EastTNAPRS
Date: 2006-01-06 16:44:37 UTC
From: Kevin R. Colvin
Topic: 1192 Message: 1192

GREETING YA'LL,

SSID, IS THAT THE CALL SIGN SUFFIX, ie:-1, BEHIND THE CALL YOU SEE ON THE SCREEN,
OR IS IT REFERING TO SYMBOLS FOR YOUR APRS STATION.
THIS WAS A QUESTION I HAD WHEN I STARTED. AND I WAS WANTING TO TRY DO THE RIGHT THING.
AND I WAS WANTING TO KNOW WHAT ALL THOSE STATIONS WITH THAT -# BEHIND THEIR CALL MENT.
SO I DID SOME READING, I BECAME MORE CORNFUSED, I DID A WEB SEARCH, AND AFTER READING A LOT
OF WEB SIGHT COMMENTS, I CAME TO UNDERSTAND THAT THE TERM "SSID" STOOD FOR TWO THINGS.
THE CALL SIGN SUFFIX, AND THE SYMBOL FOR YOUR APRS STATION.

DEPENDING ON WHAT TYPE OF PROGRAM/SYSTEM I WAS USING AND WHAT I WAS TRYING TO SET UP WOULD
DETERMINE WHAT MEANING OF SSID TO USE.

WITH THE PROGRAM I AM USING (UI-VIEW 32) THE ICON TYPE WAS SET BY THE PROGRAM WHEN I CHOOSE
HOME AS A SYMBOL.

I USED JUST MY CALL ONLY FOR A WHILE, BECAUSE I WAS JUST THAT, A PLAIN JANE HOME STATION.
THEN I TURNED ON MY HOME DIGI. TO LET OTHERS KNOW THAT I WAS ACTING AS A HOME DIGI I ADDED
THE -1 BEHIND MY CALL. PER BOB,WB4APR SUGESTION (-1 Digipeater, Home Station running a
Relay Digi, Wx Digipeater) I THOUGHT THIS WOULD LET EVERONE IN THE AREA THAT SAW ME, KNOW I
DID HAVE MY HOME DIGI ON. THIS ALSO ALOWS OTHERS WHO MAY BE CLOSE TO ME KNOW THAT I AM
SERVING AS A HOME DIGI. SO IF THEY WERE THINKING ABOUT IT, AND LETS SAY ONLY 2 MILES AWAY,
THEY MIGHT RE-EVALUATE IF THIER STATION WAS REALLY NEEDED. IF THEY HAD A BIGGER FOOT PRINT
OR BETTER COVERAGE AREA, THEY COULD CONTACT ME, AND I COULD SHUT OFF MY HOME DIGI.

WHEN I SEE A STATION WITH A "-9" BEHIND IT, I KNOW THAT THEY ARE A MOBILE, EVEN IF THEY
HAVE A BOAT ICON, OR HOUSE ICON THAT IS NAVAGATING DOWN A RIVER OF ASPHAULT.

BY USING THE SSID SUFFIX BEHIND A CALLSIGN, TO ME IS USEFULL. IF THEY ARE USED CORRECTLY.
AND BOB,WB4APR's COMMENT SAYS "These are only guidelines..."

NOW I MAY HAVE MISSED THE BOAT, I NORMALY DO. BUT AS FAR AS WX4MRX HAVING THE -1 BEHIND IT.
I THINK MOE SAID, HE WAS SETTING THAT STATION UP TO ASLO BE A "FILL-IN DIGI". SO MY
THOUGHTS WOULD BE THAT THE -1 BEHIND IT WOULD BE CORRECT. AND I DID POST EITHER A LINK TO ,
OR THE SSID LIST ON THE GROUP, SO I AM AT FAULT TOO.
THOUGH JOHN MAKES A VERY GOOD POINT. BEING A "NWS" STATION, AND A LOT OF STATIONS MAY NEED
TO SEND MESSAGES TO THEM, AND IF THEY COULD NOT SEE THAT IT HAD THE SUFFIX OF -1 BEHIND IT.
THE MESSAGES WOULD NOT GET TO WX4MRX.

SO ALL THIS FUSS OVER THE SSID, WELL, I DON'T UNDERSTAND, THERE ARE GUIDELINES OUT THERE ON
USING THEM. AND IF WE CAN NOT USE THE GUIDELINE THAT ARE ALREADY IN PLACE FOR "APRS
OPERATIONS" THEN DO WE REALLY BELEIVE THAT SOME ONE IS GOING TO FOLLOW OUR GUIDELINES.

AND YES, I DO UNDERSTAND THINGS ARE CHANGING, AND IN DIFFERENT AREAS, DIFFERENT STYLES WILL
BE USED. THATS A GIVEN. I DO NOT TOTALY DISAGREE WITH CHANGE.

THERE IS SO MUCH IMFORMATION ON THE WEB ABOUT APRS AND HOW TO DO THINGS, IT GETS REALLY CORNFUSING... SUCH AS THE TEXT BELOW THAT I ADDED IRT: SSID's. (AND I KNOW, SOME OF WHAT I ADDED BELOW MAY VERY WELL BE OUT DATED OR WRONG.)

AND I WOULD ALSO LIKE TO THANK TRAVIS ON HIS VIEW POINT... I TOO NEED TO LIGHTEN UP..
I SOMETIMES FORGET, I AM IN THIS TO HAVE FUN AND ENJOY.

KEVIN / KF4YMC

http://web.usna.navy.mil/~bruninga/aprs/SSIDs.txt

APRS SSID Defaults 20 Feb 2004

Revised 2 June 2004 to add -10, -11 and -15

Since there are 20,000 APRS users on the air, the APRS maps and data can get very cluttered. Also, most operators have multiple stations on the air, such as their HOME, CAR, BOAT, and HT. It is very convenient to be able to recognize these typical applications at a glance. Here are those common defaults:

-1, 2, 3, 4 are for digipeaters and other home stations

-6 is for Operations via Satellite
-7 is for TH-D7 walkie talkies
-8 is for boats, sailboats and ships (maybe 802.11 in the future)
-9 is for Mobiles
-10 is for operation via The internet only
-11 is for APRStouch-tone users (and the occasional Balloons)
-14 is for Truckers
-15 is for HF

Originally, in 1992, the first APRS GPS mobiles just transmitted raw NMEA-0183 GPS stings and so there was no way to insert a SYMBOL byte in the pre-formatted NMEA 183 packet. Hence we defined 14 common SYMBOLs as defaults to the 14 available SSID's that a mobile could use. These included BIKES, HELOCOPTERS, AIRCRAFT, VANS and many others in addition to the ones above. This is now OBSOLETE.

In the late 1990's we came up with a better solution and defined the AX.25 TOCALL of GPSxyz for such use. In this case, the "xyz" characters can be used to define any of the hundreds of APRS symbols including Overlays. Just look up the xyz in the SYMBOLS.TXT file included in all copies of APRSdos (or these days, on the WEB).

Since this GPSxyz concept was so powerful, it completely replaced the original SSID assignments and so those original NMEA defaults have been removed from the Documentation.

However the convention for the 6 most useful ones remains and should be used in the absesnce of any other overriding conditions. Except for the TH-D7 and Truckers, the other SSID conventions mark APRS "TYPES" of users that are independent of the many SYMBOLS they can use. Thus it is nice

to know HOW someone is getting into the system, whether via satellite, HF, the internet, or touchtone. For example, using the -6 only for Space applications is so that the global APRS WEB data bases will keep statistics and data for when you are operating through the satellites separate from when you are working normally.

So stick to the standards above for the obvious applications... Of course these are not rigid. If you have more than 4 digipeaters, use any SSID you want. These are only guidelines...

de WB4APR, Bob

http://www.aprs.net.au/aprs_ssid_guide.htm

APRS SSID Guide

Since there are 20,000 APRS users on the air, the APRS maps and data can get very cluttered. Also, most operators have multiple stations on the air, such as their HOME, CAR, BOAT, and HT. It is very convenient to be able to recognize these typical applications at a glance.

Here are those common defaults:

-0 Home Station, Home Station running IGate.
-1 Digipeater, Home Station running a Relay Digi, Wx Digipeater
-2 Digipeater [#2 or] on 70CM
-3 Digipeater [#3]
-4 HF to VHF Gateway
-5 IGate (Not home station) -6 is for Operations via Satellite
-7 Kenwood D7 HH
-8 is for boats, sailboats and ships (maybe 802.11 in the future)
-9 is for Mobiles
-10 is for operation via The internet only
-11 is for APRStouch-tone users (and the occasional Balloons)
-12 Portable Units such as Laptops, Camp Sites etc.
-14 is for Truckers
-15 is for HF

Originally, in 1992, the first APRS GPS mobiles just transmitted raw NMEA-0183 GPS stings and so there was no way to insert a SYMBOL byte in the pre-formatted NMEA 183 packet. Hence we defined 14 common SYMBOLs as defaults to the 14 available SSID's that a mobile could use. These included BIKES, HELICOPTERS, AIRCRAFT, VANS and many others in addition to the ones above. This is now OBSOLETE.

In the late 1990's we came up with a better solution and defined the AX.25 TOCALL of GPSxyz for such use. In this case, the "xyz" characters can be used to define any of the hundreds of APRS symbols including Overlays. Just look up the xyz in the SYMBOLS.TXT file included in all copies of APRSdos (or these days, on the WEB).

Since this GPSxyz concept was so powerful, it completely replaced the original SSID assignments and so those original NMEA defaults have been

removed from the Documentation.

However the convention for the 6 most useful ones remains and should be used in the absesnce of any other overriding conditions. Except for the TH-D7 and Truckers, the other SSID conventions mark APRS "TYPES" of users that are independent of the many SYMBOLS they can use. Thus it is nice to know HOW someone is getting into the system, whether via satellite, HF, the internet, or touchtone. For example, using the -6 only for Space applications is so that the global APRS WEB data bases will keep statistics and data for when you are operating through the satellites separate from when you are working normally.

So stick to the standards above for the obvious applications... Of course these are not rigid. If you have more than 4 digipeaters, use any SSID you want.
These are only guidelines...

de WB4APR, Bob

http://www.kc2hwb.com/APRS_symbols.htm

Symbols for your APRS station or tracker can be done with one of three methods.

* The first is by assigning an SSID

* The second by embedding characters in the BText line within squiggly brackets (no longer used)

* The third by embedding the character in the SENDTO address (LTP, LOC, and Unproto) paths.

The third example is the PRIMARY way to indicate your symbol on the map. This info was derived from the APRSdos symbols.txt readme file. PLEASE NOTE THIS IS FOR MOBILES ONLY! Home stations will use different symbols.

SSID METHOD

SSID Symbol NWAPRS Station Type
-0 Dot Home Station
-1 Ambulance Home PBBS
-2 Bus
-3 Firetruck
-4 Bicycle
-5 Yacht
-6 Helicopter
-7 Aircraft TH-D7 Station
-8 Ship Secondary Automobile
-9 Car Primary Automobile
-10 Motorcycle Primary WIDE
-11 Balloons Secondary WIDE
-12 Jeep
-13 RV
-14 Truck
-15 Van TCPIP Only

SYMBOLS WITH STAND-ALONE GPS TRACKERS: Since the stand-alone GPS/PACCOMM TNC trackers output the raw GPS data over the air, instead an APRS formatted position report, there are two methods that I have included for you to be able to specify the symbol type. First, there is a default SSID convention which will be used if no other vehicle data is available. See the table below.

SSID SYMBOL SSID SYMBOL

-0 Dot -8 Ships (power)

-1 Ambulance -9 Cars

-2 Bus -10 Space objects

-3 Fire truck -11 Balloons

-4 Bike -12 Jeep

-5 Yacht (sail) -13 RV (recreational vehicle)

-6 Helo -14 Truck

-7 Aircraft -15 Van

These defaults can be user definable on a net by net basis. If your net must have different defaults, contact me.

Secondly, you may indicate the desired symbol character surrounded by braces {s} as the first 3 characters of the TNC BText. Once the BText has been received by a station, the mobile will then be displayed using the specified symbol. The advantage of this method is that more symbols are available than from the SSID convention. The disadvantage is that the symbol is not displayed until AFTER at least one BText is received.

http://homepages.picknowl.com.au/wavetel/aprs.htm

Callsign SSID. It seems sensible for home stations to run with SSID 0 where possible as a convention. For messaging in particular it can cause less confusion. In UI-View this is set in Menu Setup/Station Setup in the callsign box where you can enter your own callsign with no SSID Eg. VK5XYZ . See the listed SSID conventions below which are allready in heavy use around VK.

VK guide for APRS SSID use. thanks to Bob WB4APR and Richard VK3JFK

-0 Home Station, Home Station running IGate.
-1 Network Digipeater, Wx Digipeater
-2 Digipeater [#2 or] on 70CM
-3 Digipeater [#3]
-4 HF to VHF Gateway
-5 IGate (Not home station)
-6 Satellite or special operations (usually mobiles/portables)
-7 Kenwood D7 HH
-8 Secondardy mobile/portable (Maritime applications USA, maybe 802.11 in the future)
-9 Primary Mobiles
-10 Internet only stations with no RF equipment
-11 APRS Touch Tone Via EchoLink systems (and the occasional Balloons)
-12 Portable Units such as Laptops etc.
-14 Legacy standard for Truckers (USA)
-15 HF Mobiles

Another one that I use frequenctly is -6 for "special" things like stations using the Satellites. This is so that those stations show up separately on FINDU and other systems instead of being overwritten as soon as someone QSY's back to the Terrestrial system.
Also for those that have both a D7 (-7) and a mobile (-9) but also have a D700 in the other car, I use -8...

Just my opinion, I would leave MRX's call at WX4MRX to lessen
confusion as to where to send traffic. I would maybe place a comment
in the beacon text about the digi. I wouldn't place an object on top
of MRX, as that is an extra transmission the station will have to make
that could delay or stop incoming traffic to it. Once the WX4MRX WIDE
digi is in place, I would not use WX4MRX as a fill in. Remember the
old adage, "Listen Much, Talk Little". That station needs to do that.
That's how information is received.

Just my opinion, doesn't even have to be considered.

Scott NA4IT

From: Scott
Topic: 1122 Message: 1196

Here I go with my opinion again...

I'm not a hugh fan of objects unless they are temporary and needed for
a short time. I would much rather see in the beacon text something like:

=3518.05N/08435.74W-ETOWAH TN..FILL IN DIGI R/W1-1

That tells a station looking at the BText that the sending station is
a Fill-In Digi responding to RELAY and WIDE1-1.

And here again, we must think and examine if I digi is needed. Here in
McMinn County, every station on APRS can hit KF4CFO-7, and most
mobiles traveling I-75 do also. Knoxville may be different.

1200. RE: [EastTNAPRS] TO USE A CALL SUFFIX OR NOT

Yahoo group: EastTNAPRS
Date: 2006-01-07 17:08:43 UTC
From: John Moyers
Topic: 1192 Message: 1200

Moe, that sounds like a plan..... But, don't we consider any local station as a fill-in digi when we are mobile or portable? I know that the NWS Morristown Office is in a good location to work the mountain top repeaters. But their HAAT is about 0 feet. So they would only be useful for a mobile or a portable station and and even then for only about 5 or 6 miles before the terrain would take you out of their coverage area.

Yes Kevin,

You are right I have set the NWS station to act as a fill in digi if needed in the local area... hence the dash one (-1). I was using the standard you were nice enough to provide me early on in this great big learning curve... That's what I thought was right.... but I also thought about this... setting WX4MRX as a plain old callsign... then going on top of it placing a object called WX4MRX-1 to show the fill in digi capabilities? Any thoughts on that... I would set the comments up to say send the message to WX4MRX to contact NWS?

See everyone at the ham feast tomorrow

Moe N4CQW

On 1/6/06, Kevin R. Colvin <kf4ymc@...
<mailto:kf4ymc@...> > wrote:

GREETING YA'LL,

SSID, IS THAT THE CALL SIGN SUFFIX, ie:-1, BEHIND THE CALL YOU SEE ON THE SCREEN,
OR IS IT REFERING TO SYMBOLS FOR YOUR APRS STATION.
THIS WAS A QUESTION I HAD WHEN I STARTED. AND I WAS WANTING TO TRY DO THE RIGHT THING.
AND I WAS WANTING TO KNOW WHAT ALL THOSE STATIONS WITH THAT -# BEHIND THEIR CALL MENT.
SO I DID SOME READING, I BECAME MORE CORNFUSED, I DID A WEB SEARCH, AND AFTER READING A LOT OF WEB SIGHT COMMENTS, I CAME TO UNDERSTAND THAT THE TERM "SSID" STOOD FOR TWO THINGS.

THE CALL SIGN SUFFIX, AND THE SYMBOL FOR YOUR APRS STATION.

DEPENDING ON WHAT TYPE OF PROGRAM/SYSTEM I WAS USING AND WHAT I WAS TRYING TO SET UP WOULD DETERMINE WHAT MEANING OF SSID TO USE.

WITH THE PROGRAM I AM USING (UI-VIEW 32) THE ICON TYPE WAS SET BY THE PROGRAM WHEN I CHOOSE HOME AS A SYMBOL.

I USED JUST MY CALL ONLY FOR A WHILE, BECAUSE I WAS JUST THAT, A PLAIN JANE HOME STATION.
THEN I TURNED ON MY HOME DIGI. TO LET OTHERS KNOW THAT I WAS ACTING AS A HOME DIGI I ADDED THE -1 BEHIND MY CALL. PER BOB,WB4APR SUGESTION (-1 Digipeater, Home Station running a Relay Digi, Wx Digipeater) I THOUGHT THIS WOULD LET EVERONE IN THE AREA THAT SAW ME, KNOW I DID HAVE MY HOME DIGI ON. THIS ALSO ALOWS OTHERS WHO MAY BE CLOSE TO ME KNOW THAT I AM SERVING AS A HOME DIGI. SO IF THEY WERE THINKING ABOUT IT, AND LETS SAY ONLY 2 MILES AWAY, THEY MIGHT RE-EVALUATE IF THIER STATION WAS REALLY NEEDED. IF THEY HAD A BIGGER FOOT PRINT OR BETTER COVERAGE AREA, THEY COULD CONTACT ME, AND I COULD SHUT OFF MY HOME DIGI.

WHEN I SEE A STATION WITH A "-9" BEHIND IT, I KNOW THAT THEY ARE A MOBILE, EVEN IF THEY HAVE A BOAT ICON, OR HOUSE ICON THAT IS NAVAGATING DOWN A RIVER OF ASPHAULT.

BY USING THE SSID SUFFIX BEHIND A CALLSIGN, TO ME IS USEFULL. IF THEY ARE USED CORRECTLY.
AND BOB,WB4APR's COMMENT SAYS "These are only guidelines..."

NOW I MAY HAVE MISSED THE BOAT, I NORMALY DO. BUT AS FAR AS WX4MRX HAVING THE -1 BEHIND IT.
I THINK MOE SAID, HE WAS SETTING THAT STATION UP TO ASLO BE A "FILL-IN DIGI". SO MY THOUGHTS WOULD BE THAT THE -1 BEHIND IT WOULD BE CORRECT. AND I DID POST EITHER A LINK TO , OR THE SSID LIST ON THE GROUP, SO I AM AT FAULT TOO.
THOUGH JOHN MAKES A VERY GOOD POINT. BEING A "NWS" STATION, AND A LOT OF STATIONS MAY NEED TO SEND MESSAGES TO THEM, AND IF THEY COULD NOT SEE THAT IT HAD THE SUFFIX OF -1 BEHIND IT. THE MESSAGES WOULD NOT GET TO WX4MRX.

SO ALL THIS FUSS OVER THE SSID, WELL, I DON'T UNDERSTAND, THERE ARE GUIDELINES OUT THERE ON USING THEM. AND IF WE CAN NOT USE THE GUIDELINE THAT ARE ALREADY IN PLACE FOR "APRS OPERATIONS" THEN DO WE REALLY BELEIVE THAT SOME ONE IS GOING TO FOLLOW OUR GUIDELINES.

AND YES, I DO UNDERSTAND THINGS ARE CHANGING, AND IN DIFFERENT AREAS, DIFFERENT STYLES WILL BE USED. THATS A GIVEN. I DO NOT TOTALY DISAGREE WITH CHANGE.

THERE IS SO MUCH IMFORMATION ON THE WEB ABOUT APRS AND HOW TO DO THINGS, IT GETS REALLY CORNFUSING... SUCH AS THE TEXT BELOW THAT I ADDED IRT: SSID's. (AND I KNOW, SOME OF WHAT I ADDED BELOW MAY VERY WELL BE OUT DATED OR WRONG.)

AND I WOULD ALSO LIKE TO THANK TRAVIS ON HIS VIEW POINT... I TOO NEED TO LIGHTEN UP..

I SOMETIMES FORGET, I AM IN THIS TO HAVE FUN AND ENJOY.

KEVIN / KF4YMC

http://web.usna.navy.mil/~bruninga/aprs/SSIDs.txt
<http://web.usna.navy.mil/%7Ebruninga/aprs/SSIDs.txt>

APRS SSID Defaults 20 Feb 2004

Revised 2 June 2004 to add -10, -11 and -15

Since there are 20,000 APRS users on the air, the APRS maps and data can get very cluttered. Also, most operators have multiple stations on the air, such as their HOME, CAR, BOAT, and HT. It is very convenient to be able to recognize these typical applications at a glance. Here are those common defaults:

-1, 2, 3, 4 are for digipeaters and other home stations

-6 is for Operations via Satellite
-7 is for TH-D7 walkie talkies
-8 is for boats, sailboats and ships (maybe 802.11 in the future)
-9 is for Mobiles
-10 is for operation via The internet only
-11 is for APRStouch-tone users (and the occasional Balloons)
-14 is for Truckers
-15 is for HF

Originally, in 1992, the first APRS GPS mobiles just transmitted raw NMEA-0183 GPS stings and so there was no way to insert a SYMBOL byte in the pre-formatted NMEA 183 packet. Hence we defined 14 common SYMBOLs as defaults to the 14 available SSID's that a mobile could use. These included BIKES, HELOCOPTERS, AIRCRAFT, VANS and many others in addition to the ones above. This is now OBSOLETE.

In the late 1990's we came up with a better solution and defined the AX.25 TOCALL of GPSxyz for such use. In this case, the "xyz" characters can be used to define any of the hundreds of APRS symbols including Overlays. Just look up the xyz in the SYMBOLS.TXT file included in all copies of APRSdos (or these days, on the WEB).

Since this GPSxyz concept was so powerful, it completely replaced the original SSID assignments and so those original NMEA defaults have been removed from the Documentation.

However the convention for the 6 most useful ones remains and should be used in the absesnce of any other overriding conditions. Except for the TH-D7 and Truckers, the other SSID conventions mark APRS "TYPES" of users that are independent of the many SYMBOLS they can use. Thus it is nice to know HOW someone is getting into the system, whether via satellite, HF, the internet, or touchtone. For example, using the -6 only for Space applications is so that the global APRS WEB data bases will keep

statistics and data for when you are operating through the satellites separate from when you are working normally.

So stick to the standards above for the obvious applications... Of course these are not rigid. If you have more than 4 digipeaters, use any SSID you want. These are only guidelines...

de WB4APR, Bob

http://www.aprs.net.au/aprs_ssid_guide.htm

APRS SSID Guide

Since there are 20,000 APRS users on the air, the APRS maps and data can get very cluttered. Also, most operators have multiple stations on the air, such as their HOME, CAR, BOAT, and HT. It is very convenient to be able to recognize these typical applications at a glance.

Here are those common defaults:

-0 Home Station, Home Station running IGate.
-1 Digipeater, Home Station running a Relay Digi, Wx Digipeater
-2 Digipeater [#2 or] on 70CM
-3 Digipeater [#3]
-4 HF to VHF Gateway
-5 IGate (Not home station) -6 is for Operations via Satellite
-7 Kenwood D7 HH
-8 is for boats, sailboats and ships (maybe 802.11 in the future)
-9 is for Mobiles
-10 is for operation via The internet only
-11 is for APRStouch-tone users (and the occasional Balloons)
-12 Portable Units such as Laptops, Camp Sites etc.
-14 is for Truckers
-15 is for HF

Originally, in 1992, the first APRS GPS mobiles just transmitted raw NMEA-0183 GPS stings and so there was no way to insert a SYMBOL byte in the pre-formatted NMEA 183 packet. Hence we defined 14 common SYMBOLs as defaults to the 14 available SSID's that a mobile could use. These included BIKES, HELICOPTERS, AIRCRAFT, VANS and many others in addition to the ones above. This is now OBSOLETE.

In the late 1990's we came up with a better solution and defined the AX.25 TOCALL of GPSxyz for such use. In this case, the "xyz" characters can be used to define any of the hundreds of APRS symbols including Overlays. Just look up the xyz in the SYMBOLS.TXT file included in all copies of APRSdos (or these days, on the WEB).

Since this GPSxyz concept was so powerful, it completely replaced the original SSID assignments and so those original NMEA defaults have been removed from the Documentation.

However the convention for the 6 most useful ones remains and should be used in the absesnce of any other overriding conditions. Except for the TH-D7 and Truckers, the other SSID conventions mark APRS "TYPES" of users that are independent of the many SYMBOLS they can use. Thus it is nice to know HOW someone is getting into the system, whether via satellite, HF, the internet, or touchtone. For example, using the -6 only for Space applications is so that the global APRS WEB data bases will keep statistics and data for when you are operating through the satellites separate from when you are working normally.

So stick to the standards above for the obvious applications... Of course these are not rigid. If you have more than 4 digipeaters, use any SSID you want.
These are only guidelines...

de WB4APR, Bob

http://www.kc2hwb.com/APRS_symbols.htm

Symbols for your APRS station or tracker can be done with one of three methods.

* The first is by assigning an SSID

* The second by embedding characters in the BText line within squiggly brackets (no longer used)

* The third by embedding the character in the SENDTO address (LTP, LOC, and Unproto) paths.

The third example is the PRIMARY way to indicate your symbol on the map. This info was derived from the APRSdos symbols.txt readme file. PLEASE NOTE THIS IS FOR MOBILES ONLY! Home stations will use different symbols.

SSID METHOD

SSID Symbol NWAPRS Station Type
-0 Dot Home Station
-1 Ambulance Home PBBS
-2 Bus
-3 Firetruck
-4 Bicycle
-5 Yacht
-6 Helicopter
-7 Aircraft TH-D7 Station
-8 Ship Secondary Automobile
-9 Car Primary Automobile
-10 Motorcycle Primary WIDE
-11 Balloons Secondary WIDE
-12 Jeep
-13 RV
-14 Truck
-15 Van TCPIP Only

SYMBOLS WITH STAND-ALONE GPS TRACKERS: Since the stand-alone GPS/PACCOMM TNC

trackers output the raw GPS data over the air, instead an APRS formatted

position report, there are two methods that I have included for you to be able

to specify the symbol type. First, there is a default SSID convention which

will be used if no other vehicle data is available. See the table below.

SSID SYMBOL SSID SYMBOL

-0 Dot -8 Ships (power)

-1 Ambulance -9 Cars

-2 Bus -10 Space objects

-3 Fire truck -11 Balloons

-4 Bike -12 Jeep

-5 Yacht (sail) -13 RV (recreational vehicle)

-6 Helo -14 Truck

-7 Aircraft -15 Van

These defaults can be user definable on a net by net basis. If your net

must have different defaults, contact me.

Secondly, you may indicate the desired symbol character surrounded by

braces {s} as the first 3 characters of the TNC BText. Once the BText

has been received by a station, the mobile will then be displayed using

the specified symbol. The advantage of this method is that more

symbols are available than from the SSID convention. The disadvantage

is that the symbol is not displayed until AFTER at least one BText is

received.

http://homepages.picknowl.com.au/wavetel/aprs.htm

Callsign SSID. It seems sensible for home stations to run with SSID 0 where possible as a convention. For messaging in particular it can cause less confusion. In UI-View this is set in Menu Setup/Station Setup in the callsign box where you can enter your own callsign with no SSID Eg. VK5XYZ . See the listed SSID conventions below which are allready in heavy use around VK.

VK guide for APRS SSID use. thanks to Bob WB4APR and Richard VK3JFK

-0 Home Station, Home Station running IGate.
-1 Network Digipeater, Wx Digipeater
-2 Digipeater [#2 or] on 70CM
-3 Digipeater [#3]
-4 HF to VHF Gateway
-5 IGate (Not home station)
-6 Satellite or special operations (usually mobiles/portables)
-7 Kenwood D7 HH
-8 Secondardy mobile/portable (Maritime applications USA, maybe 802.11 in the future)
-9 Primary Mobiles
-10 Internet only stations with no RF equipment
-11 APRS Touch Tone Via EchoLink systems (and the occasional Balloons)
-12 Portable Units such as Laptops etc.
-14 Legacy standard for Truckers (USA)
-15 HF Mobiles

Another one that I use frequenctly is -6 for "special" things like stations using the Satellites. This is so that those stations show up separately on FINDU and other systems instead of being overwritten as soon as someone QSY's back to the Terrestrial system.
Also for those that have both a D7 (-7) and a mobile (-9) but also have a D700 in the other car, I use -8...

From: John Moyers
Topic: 1122 Message: 1201

Your right Campbell, Anderson, Morgan, and Scott Counties can be bears to communicate out of. My office operates 6 repeaters to cover this area and we still don't have 100% coverage with 100 watt mobiles. Moe, it's the nature of the beast.

Subject: Re: [EastTNAPRS] Re: Idea on Skywarn Object posting

Knoxville seems to have big gaps to the West and the North... My Digi seems to help with that...I am at a high spot and seem to be able to hear pretty go both directions... I know sometimes Jeff KF4UVT has to go thru me to be heard...

If you get into Anderson county you can forget it in most places... I run 50 watts mobile and have a hard time being seem... same thing with Campbell County.

Here I go with my opinion again...

I'm not a hugh fan of objects unless they are temporary and needed for a short time. I would much rather see in the beacon text something like:

=3518.05N/08435.74W-ETOWAH TN..FILL IN DIGI R/W1-1

That tells a station looking at the BText that the sending station is a Fill-In Digi responding to RELAY and WIDE1-1.

And here again, we must think and examine if I digi is needed. Here in McMinn County, every station on APRS can hit KF4CFO-7, and most mobiles traveling I-75 do also. Knoxville may be different.

I agree with Scott on this one. An object to indicate that the station is a fill-in digi seems like more than would be necessary. In general, I don't think fill-in digi's need any special identification (no icon change or SSID change). It would not hurt to say something about it in your BText.

1204. Weather Alert Counties with UI-View

Yahoo group: EastTNAPRS
Date: 2006-01-07 19:24:19 UTC
From: William McKeehan
Topic: 1204 Message: 1204

Here are some directions for seeing weather alert couties in UI-View with precision mapping. I do not have precision mapping, so I can't test it out.

Let me know if this makes sense to any of you that do use precision mapping.

Hi all,

William McK. wrote:

>I am interested in getting the NWS shape files to "light up" ...
>but I can't find instructions for how to do this with UI-View.
>Can you provide a pointer to how to set this up for UI-View?

First, you need to be running a version of Precision Mapping version 5 or better with the appropriate Pmap server installed (to buy that program, see http://www.undertowsoftware.com/PMSAT/PMSAT.htm). You also need to download UI-NWS, but I can't seem to find this file either. It's too big for me to put into the UI-View files section of groups.yahoo.com, but I'd be glad to attach it to William if he likes.

Once you have it, these instructions describe how and where to get those shapefiles:

==========
========

Downloading The Shapefiles
To be able to use UI-NWS, you need the NWS shapefiles for counties, zones and marine zones. UI-NWS is useless without these files. They are the shapefile sets prefixed "c_", "z_" and "mz". Each set contains three files - .DBF, .SHP and .SHX.

If you have already downloaded these shapefiles for use with other software, then you can use your existing files. Otherwise, you need to download them from the NWS site. The starting page is http://www.nws.noaa.gov/geodata/

The files seem to be frequently updated, so the direct URLs for the latest versions change, but if you start at the above page, you can find the files by following these links. NOTE - Read the following carefully! The wording of the link names is correct, but an awful lot of users seem to assume that I have made a mistake, and so download the wrong files.

Zones
NWSI Libraries: Zone Forecast Areas, and then Public Forecast Zones (CONUS/OCONUS), Download Compressed shapefile.

Marine zones
NWSI Libraries: Coastal And Offshore Marine Zones, and then Coastal Marine Zones including the Great Lakes, Download Compressed shapefile.

Counties
County Libraries: AWIPS Counties, and then US Counties (CONUS/OCONUS), Download Compressed shapefile.
NOTE - To get to this link, you have to scroll down the page! It is NOT the 'County Warning Areas' link near the top of the page!

When you have got the files, they need to be unzipped into a folder that will be created the first time UI-View32 V1.5 or later is run. The folder is \NWS\Shapefiles in the UI-View32 program folder. Make sure you put them in the correct folder, or UI-View32 will not find them! You can tell if you are putting them in the correct folder, because it will contain a file called "Put the NWS shapefiles in here.TXT".

I agree 100% Moe, MRX is kinda in an out of the way area. Once the big digi goes of, it should be OK without it. Your doing a good job.

1206. Re: Weather Alert Counties with UI-View

Yahoo group: EastTNAPRS
Date: 2006-01-07 21:12:00 UTC
From: Scott
Topic: 1204 Message: 1206

William,

Most of our stations here locally use UI-NWS with Delorme Street Atlas (or topo maps). The downloads from the WX Service of the shapefiles are fairly large, but that's the only way you can do it. UI-NWS is a pretty neat feature, as if you are hooked to the internet, you can get a lot of WX data in one program. I also was using UI-Radar, but I have found it to give problems corrupting map files if you happen to switch maps with it refreshing a radar. (and this may be a problem on only my machine). it does it so bad, I have to go into DOS to delete that bad map.

Below are the links and file sizes for the WX Shapefiles. Download them and unzip them into the UI-VIEW NWS/Shapefiles folder.

http://www.weather.gov/geodata/catalog/wsom/data/z_06oc05.zip
(about 9 megs)

http://www.weather.gov/geodata/catalog/wsom/data/w_06oc05.zip
(about 3 megs)

http://weather.gov/geodata/catalog/wsom/data/mz12jl05.zip
(about 3 megs)

http://weather.gov/geodata/catalog/wsom/data/oz15de04.zip
(about 2KB)

From: Greg Williams
Topic: 1192 Message: 1207

Last time I was at MRX, it was for the SKYWARN event on Dec 3. I was hitting repeaters and simplex stations from NC to Georgia. I even had a small bout of E-skip and got a guy near Jacksonville, FL on 652 simplex! And this was on an antenna set up for the event, not the one on the normal tower.

MRX has great coverage. There is a lot of wide-open range all around the area at MRX. I think a digi would work well there.

From: Roy E. Pollard
Topic: 1192 Message: 1209

At the Hamfest parking lot today I was digi by a unknown digi about half the time.
WA4KJH-7 was the other half of the time. From my home station I was hearing the
unknown digi direct. The unknown digi does not have call sign substution turned on.

I wonder if WX4MRX is the unknown digi? WA4BDS-9 has a path of RELAY,WIDE.

I was there with Roy today and saw the same thing. Note that we also saw this digi (we assume it is the same digi) respond to WIDE. We would see packets with paths like WA4KJH-7,WIDE* and we were not hearing WA4KJH-7 direct there.

Thanks for helping clear this up Scott; especially the fact that you do not need Precision Mapping to use UI-NWS.

Once I have the shapefiles in place, I go back into UI-View and select File\UI-NWS and start UI-NWS. I have a map file opened (created from DeLorme, by Kevin actually). When alerts are active do I need to do anything special to get them to display on this map?

There was a lot of stuff there and crowded enough that I had a hard time
finding things on my list.
I found a buyer for my MFJ sound card interface.

Guess I have grown too much lately.

Any and all WX "objects" that trigger the shapefiles will appear on the map. And I mean ALL. Unless you have your APRS server connections "filtered". (Mine stays filtered to SPC, MRX, HTX, OHX, unless I am watching FL during hurricanes in my sons area down there.)

You can also set up specific warning that will set off a siren sound in your speakers for specific counties, just like the SAME WX radios.

WHOOP, WHOOP!

Who ever goes to check MRX, if you will look in the FILES section of
this group, there is a jpg shot of the UI-VIEW Fill-in Digi setup. Do
it like that and you will be "good to go".

I say leave the digi on until the WIDE goes up.

That's one draw back in UI-VIEW (and it may be in all APRS softwares) that if any one types even one letter in the message window, the auto respoder turns off.

NA4IT

OH yea Moe, I meant to say the KPC3 is a great chioce for up there. That's what I use at KF4CFO-7, and the latest and greatest version will be in Kevin's KF4YMC-3 digi when it goes up.

I don't think it is MRX because I can hit the unknown direct but I can not hit MRX direct. I am starting to believe it may not be one on the map. Since the coverage area seems pretty large it may be harder to find than I had thought. BUT given a little time and energy I think we can narrow it down.

Good to see many of you at Morristown today.

At the Hamfest parking lot today I was digi by a unknown digi about half
the time.
WA4KJH-7 was the other half of the time. From my home station I was
hearing the
unknown digi direct. The unknown digi does not have call sign substution
turned on.

I wonder if WX4MRX is the unknown digi? WA4BDS-9 has a path of RELAY,WIDE.

Scott;

I have downloaded the files from your list. Are these replacement files
for the ones I already
have or they just additional files for the NWS\Shapefiles
directory. Should I erase the ones I have
before adding this set?

I am on dial-up internet. I notice that several areas on my Ui-View32 map
are yellow today.
Guess we have a high wind warning in some of the local areas and the files
I have been using
are still doing something.

Roy,

Those are the current files as of about 2 days ago. I had someone else
getting set up ask for them. They do change from time to time, but I
don't know how much.

1226. Re: Weather Alert Counties with UI-View

Yahoo group: EastTNAPRS
Date: 2006-01-08 14:36:12 UTC
From: William McKeehan
Topic: 1204 Message: 1226

Thanks for the directions Scott. I tried it last night and was able
to see the shape files light up.

If you are interested in weather watching with UI-View, I would
highly recommend getting the shapefiles and setting up UI-NWS.

I have looked at the stream for the last 12 hours and do not see the mystery relay digi.
Has anyone see it since yesterday?

Moe,

In UI-VIEW, the status text is defaulted to be sent out every 60
minutes. It is changeable, in the status text setup.

1233. Finding the mystery digi

Yahoo group: EastTNAPRS
Date: 2006-01-08 18:49:12 UTC
From: William McKeehan
Topic: 1233 Message: 1233

Let's see if we can draw some circles and get a better idea of where the mystery digi is located.

To do this, I think we need a list of all of the people that can hear the mystery digi directly. Once we have that list, we should be able to "triangulate" it's position somewhat, right?

It would also help to know who does not hear the digi direct. I do not hear it direct.

William
KI4HDU

1234. Re: Finding the mystery digi

Yahoo group: EastTNAPRS
Date: 2006-01-08 18:55:22 UTC
From: William McKeehan
Topic: 1233 Message: 1234

I should point out that the only way I know to identify if you can hear the mystery digi direct is to look at your packets received from K4CHT-2; if you see them with a path of RELAY*,WIDE, then you are hearing the mystery digi direct.

I believe at this point that the mystery digi is one that is not showing up on our maps (i.e., not transmitting an APRS position packet).

1235. Re: Finding the mystery digi

Yahoo group: EastTNAPRS
Date: 2006-01-08 20:43:27 UTC
From: William McKeehan
Topic: 1233 Message: 1235

I did some looking at my log files and it looks like the mystery digi digi'd WO5P down near Vonore, KG4GUL in Maryville, KF4UVT in Anderson County, WA4DAC along I-40/640/75 (east to north), KE4FGW, WA4BDS and KI4HDU in the Morristown area. It also covered me VERY well in the Jefferson City area.

So either this digi has a good set of ears or we are looking for multiple digi's. It is possible that the digi has a good shot down the valley to hear all of these stations.

Anyone else have any ideas?

One more thought on this subject...

This digi may be the one that was sending a CW ID on 144.39 for a while. I never heard it, so I do not know if it is still happening, but if anyone has heard and decoded the CW, that may help also.

I copy the mystery digi direct very well at my home station and I can supply Ui-View32 logs with many examples.

I have been looking through my log for today and most of the mystery digi
relays
today are of K4CHT-2. That station is a fixed location weather station
with a path of
RELAY,WIDE. K4CHT-2 should be able to use a path that starts with WA4KJH-7
and then the mystery digi will only digi our mobiles.

I only hear the mystery digi part of the time. His location is probably in
the Jefferson
City area.

1239. Mystery CW ID

Yahoo group: EastTNAPRS
Date: 2006-01-09 16:47:30 UTC
From: William McKeehan
Topic: 1239 Message: 1239

We may have an answer to the mystery CW ID on 144.39.

KA4TAR was out of town around Christmas. When he returned, he found that his TNC (a KPC3) had been modified. It is possible that the CW ID had been enabled on this TNC with these modifications. I spoke with KA4TAR on Sunday and he was not sure if that setting was on or not because he did not check it specifically; he simply reset the TNC to factory defaults and started over.

If anyone continues to hear any CW ID on 144.39, let the group know so we can try to find it's source and put an end to it.

Let's hope this is one mystery solved.

William

From: William McKeehan
Topic: 1240 Message: 1240

In another post, I mentioned that KA4TAR's KPC3 was modified while he was out of town. It is possible that his TNC was modified by someone using the "remote" option on the KPC3.

So as a reminder, if you're running a TNC with the remote option, you want to make sure it's either OFF or password protected.

I had a good time at the hamfest. Got to meet a few folks and got to look at all the shiny things. I picked up an antenna for my TH-D7; it's long and gets in the way, but it seems to work a lot better than the stock antenna.

The mystery digi has been identified.

It was WX4MRX-1.

WX4MRX has updated their configuration so the station callsign is now only WX4MRX; it is a fill-in digi responding to WX4MRX,RELAY,WIDE1-1 and it is doing alias substitution.

It was noted earlier that WX4MRX seems to be in a good location to act as a fill-in digi, covering the Morristown and Jefferson City areas and possibly others unknown.

So mystery solved!

Well...it seems there is another mystery digi around.

I'm still seeing K4CHT-2 with RELAY,WA4KJH-7* as it's path.

So the search for the mystery digi continues.

The question is, before we are sure MRX was it, was the alias turned on BEFORE it was changed. If it was, MRX is not the mystery digi.

We've got one down here on our end also.

The mystery digi may very well be someone who is using a TNC that's
was not fully reset befoe the APRS software they are using started. It
may have "RELAY" in the TNC's ALIAS parameter. I can do that with
UI-VIEW and my PK232.

But it ain't me!

WX4MRX was one of the mystery digi's. He did not have Alias
Substitution checked before the changes today. WX4MRX is now showing
in the path of K4CHT-2, but there are some packets that also show just
RELAY in there.

1250. Re: Finding the mystery digi

Yahoo group: EastTNAPRS
Date: 2006-01-12 04:07:58 UTC
From: William McKeehan
Topic: 1233 Message: 1250

I saw an interesting packet this evening. W9THI was digi'd by a mystery digi, then by WX4MRX (I think WX4MRX has a slight configuration problem in that their alias list is WX4MRX,RELAY,WIDE,1-1 as opposed to the desired WX4MRX,RELAY,WIDE1-1). Shortly after I saw that packet, Moe sent an ?APRSD query to WX4MRX; it had only heard 3 stations direct: WA4KJH-7,K4CHT-2 and KA4TAR.

The packet I heard was:

W9THI>APW251,RELAY,WX4MRX,WA4KJH-7*:=3557.76N/08504.01W-PHG7258/>>>
John in Crossville TN <<< -TNCUMCROSSVIL-251<630>

at 22:04:29 local time tonight.

I think KA4TAR is configured as a digi, but I have not seen his ID in any paths today; maybe he's the current mystery digi?

1252. Re: [EastTNAPRS] Re: Finding the mystery digi

Yahoo group: EastTNAPRS
Date: 2006-01-12 06:47:23 UTC
From: Jeff Yawn
Topic: 1233 Message: 1252

Well almost but not really. In the packet you listed

W9THI>APW251,RELAY,WX4MRX,WA4KJH-7*:=3557.76N/08504.01W-PHG7258/>>>
John in Crossville TN <<< -TNCUMCROSSVIL-251<630>

The only station in this list that actually digi'd the packet was WA4KJH-7 because it is the only one the has an * behind it's call. The "relay,wx4mrx" is the part of his path that was unchanged. If either of those had digi'd it there would be an * after each as in the example below. Each station that digi's a packet adds the * even if there are others listed. This is the only true way to know the return path.

01:06:49R K4CHT-2>APTW01,RELAY*,WIDE <UI Len=50>:
_01120159c292s000g000t041r000p016P000h65b10181tRSW
01:06:50R K4CHT-2>APTW01,RELAY*,WA4KJH-7* <UI Len=50>:
_01120159c292s000g000t041r000p016P000h65b10181tRSW
01:06:52R K4CHT-2>APTW01,WX4MRX*,WIDE <UI Len=50>:
_01120159c292s000g000t041r000p016P000h65b10181tRSW
01:06:53R K4CHT-2>APTW01,WX4MRX*,WA4KJH-7* <UI Len=50>:
_01120159c292s000g000t041r000p016P000h65b10181tRSW

MRX does the substitution correct. The little comma between wide and 1-1 make KJH digi the packet twice but that is a minor adjustment.
I did not speak up in the earlier post because I thought there was some merit to the fact the MRX could be incorrect but I did not think it was the digi I was looking for as I know I can not hit MRX direct on a good day with a tail wind. KA4TAR is on my direct list but I have not checked to see if it will digi by it's call sign from here.

I sent this out to prove a point that you can have anything in you path.
01:41:52R KF4UVT>APU25N,WA4KJH-7*,MOE,IS,A,SILLY,BOY <UI C Len=30>:
=3604.76N/08409.94W- {UIV32N}

BTW the above packets from k4cht are from this evening.

I agree on MRX's UNPROTO. It is suggested never to run WIDE1-1 at the end of a string.

A better solution, if what is trying to be done at MRX is use both old and new pardigms is to run WIDE2-2 (or even WIDE3-3) in the UNPROTO. (The WIDE1-1,WIDE2-2 isn't needed there, WA4KJH-7 can hear it well, and the WIDE1-1 is the same as RELAY.) The only reason I would even suggest WIDE3-3 is that MRX needs to be seen all across E TN. If WIDE2-2 gets the job done, then so be it. If it takes WIDE3-3, OK.

Then, in METEOR mode run APU25N,WIDE,WIDE at 1800 seconds, with the same Beacon Text in it.

Then once the E TN system is fully on the new pardigms, kill the meteor mode.

I disagree.

The * is a textual representation of a bit; different TNC's show it differently. NOTHING that I see from WA4KJH-7 has a * anywhere in it's path except after WA4KJH-7.

You can have anything in your path, but put something bogus in before WA4KJH-7 in your example below and you will not get digi'd.

That was not the UNPROTO that I was talking about; it is the Alias Substitution List that has WX4MRX,RELAY,WIDE,1-1 and should have WX4MRX,RELAY,WIDE1-1.

We're just setting it up as a fill-in digi.

Dose anyone have KD4CCO listed in your log on 01/12/2006 at or about 13:21 Z // 08:21 local

If so, could you copy and paste his/her data on an e-maill, and send it to me. (just the entrie(s) for KD4CCO)

David that is the way UI-View shows the paths, I can not explian how or why, so I will not try.
here is a nother example.

this is from log 20060103
02:52:33R WX4MRX-1>APU25N,WA4KJH-7*,WIDE2-2 Port=1 <UI C Len=57>: =3610.09N/08324.15WWNew Skywarn Weather Station {UIV32N}
02:52:34R WX4MRX-1>APU25N,WA4KJH-7*,KF4CFO-7*,WIDE2-1 Port=1 <UI C Len=57>: =3610.09N/08324.15WWNew Skywarn Weather Station {UIV32N}

This has been a discussion point on the APRS Sig on TAPR; apparently it depends on the TNC that you are using.

The * is a textual representation of a bit; some TNC's only show the * for the last station that digi'd the packet while others show the * for each one that has digi'd the packet. In the packet, the bits remain set for future hops.

How many home and mobile stations in the Knoxville area are running as a digi, fill-in or other wise?

Topic: 1265 Message: 1266

Here are the ones that I am aware of:

KI4HDU, N4CQW-1, WA4BDS, KC4TWO-2, WX4MRX, KA4TAR, WA4RYW-1

All with the exceptions of KA4TAR are configured as fill-in digi's (by fill-in, I mean they respond to their call, RELAY and WIDE1-1 and maybe TN). And then there's WA4KJH-7 and N4TJM-1.

Anyone else running a digi?

You thinking that's too many? One way to evaluate that is to look at packets and see if they are duplicating the work of another digi. I think that they each have an area that they cover and have very little if any overlap with each other.

1267. Re: Question that may get me shot

Yahoo group: EastTNAPRS
Date: 2006-01-14 04:44:02 UTC
From: Scott
Topic: 1265 Message: 1267

Well, here is my thought.

Tonight, I was trying to help a fellow ham set up to message a ham up there. I tried many combinations of digi's to no avail. Weird thing was, the ham we were trying to message was being digi'd by KF4CFO-7.

Here's my thought:

What happens in a Skywarn event when multiple stations and objects are being beaconed out and several digis are picking up the signals at the same time?

Packet collision, and no one actually recieves any decodable data?

I know we have talked about "direct paths", but if packet collison is the problem, direct path won't fix that.

Just trying to think ahead.

And, I don't remember the call, but there was a station in the KNOX area that evidently had their beacon set to something like WIDE2-2,RELAY. Not sure about the WIDE2-2, but I did see the RELAY at the end of the path here.

I'm not gripeing or trying to cause grief, just offering things we need to take a serious look at.

Senario, say station A is 10 miles from station B. Both should be able to theoreticly message each other with RFONLY in their message path. But, there are 4 fill-in digis with in a 25 mile circle of both stations, digiing any station that has RELAY or WIDE1-1 in their path.

Are station A & B going to be able to reliably communicate?

I have thought about what would be a good guideline for determining a need of a fill-in digi. And this is probably not a good answer, but if a station could hit the location of an existing digi station on voice with an S-5 or better signal, there is probably no need for a fill-in digi. I know watching my S meter and seeing if packets decode, reliable packet decoding happens at S-5 or better on my rigs.

Many of you have been at this much, much longer than I. I know I don't have the answers.

I know looking at what to do with KF4CFO-7 when No Pone goes up, I realize it will need to be cut WAY back from what it does now. I can hit No-Pone on simplex voice S-9 with 10 watts from where I am, and I'm almost on the Eastern side of McMinn Co. So I know I won't need

KF4CFO-7 to digi me to it. No Pone I believe is a true replacement for what KF4CFO-7 needed to be.

Just trying to make the system better, and it is going to be a continual process.

I do not think Scott was even entertaining the idea of having fill-in home digis shut down. If he saw what I think I saw, then he is just noticing there are more fill-in digis than we think, and a lot of doups are being sent. and not all do to the fill-in digi. Some stations are using paths that might not be just right, ie "wide, wide1-1" and "wide, relay".

We all know there are a few things we need to iron out, and I think we are doing a good job at fixing our local diffulcuties.
And East TN is not the only area with this prob.

And I truley think Scott just saw something and wanted to bring it to all of our attention before it creates a bigger problem than we will be able to handle.

But again this is only me and my thinking... and I know I have rocked the boat more than once my self..

Have fun, and enjoy. . . Kevin / KF4YMC

I am going to respond to this in sections. Each answer will have a **
at the beginning. As I figured, I make a suggestion, then get my tail
chewed. I am just about tierd of seeing people offer suggestions, just
to get shot at...

--- In EastTNAPRS@yahoogroups.com, Moe Brewer <moebrewer@g...> wrote:
So what is your point? Kill all the fill in's? That is your point
correct... granted it will leave major gaps here....

**Moe, did you read anywhere in the message that I said to kill all
fill in digi's? I don't think you did.

Mine covers the West and the North fairly decent... N4TJM helps
KC4ASF who seems to be in hole when he's on... also WA4BDS uses him
from time to time...I am not sure who else has one.. WX4MRX is a fill
in... But I can kill mine and the next time I am up at MRX I can kill
if it's creating too much traffic.

**I think it has already been well estabilshed that MRX does need to
be a fill in digi until the WIDE goes up.

Most of the home fill in help the mobile stations passing thru... or
out and about... I know from experience running mobile APRS WA4KJH has
a very hard time hearing some of the mobiles or odd location
stations... They are not in the shadow of the digi so they need
help... I run RELAY,WIDE1-1. I have tried a direct path and it is
useless to say the least even running a 50 watt mobile... but we also
have people from time to time who need help getting into the big
digi... I know Jeff has used my station from time time to be seen... 3
counties away not just on the other side of the county like me.

**If the digis are truly needed that's fine. We just need to make sure
they are needed.

Most of the people when we are talking try to go direct but sometimes
we can't, so we use direct to WA4KJH-7... I know most of the people
here run a direct path NOT WIDE2-2 with seems to be coming from others
on the fringe area of the digi. I noticed a lot of traffic that goes
thru WA4KJH at times are people out the local area using a really wide
path instead of a direct one to a local digi... but I am not the one
make that call on how others set up there station.

**The direct path is a better way to go. As has been stated before,
WIDE2-2, WIDE1-1, RELAY, etc are all generic aliases.

Guess my question is I see stations running a path "Digi-x then
they're tacking on a WIDE2". I am confused by this.. the digi sending

the message out I understand..but why add on the WIDE2... is that not "jamming" the frequency up for others out side the "Digi-X" area? Is that not making a the message path twice as wide as should be? If a message is going to Station-X via Digi-X who is in the path of DIgi-X is that sending the same message up the pipe line to who ever hears the WIDE2? Is that creating a unnecessary hops? Doesn't that also create a "large" beacon area also.... the beacon path would be rather larger then necessary would it not? Would this not be a example of using 2 direct paths to get a message to someone without broadcasting it on a large path? Like Digi-X, Digi-Z... would not adding a wide or wide2 at the end just place more traffic in areas where the message was not intended to go?

**I agree whole heartedly.

I am also confused by this RF only statement... if your under the decent coverage digi or filling the path and coverage should be alright. Why not use a I-Gate to gate you onto the Internet then your not tieing up the RF path ways with traffic. Seems to me that is creating more and wider RF traffic doing that? Maybe I am wrong... but does a I-Gate not repeat a message it hears on RF it is directed to a station it hears? Using a I-Gate, to me would be a more reliable means to get message to a distant area than limiting something to RF only and taking multiple digi hops in EVERY direction instead of the one the traffic is headed for? To me I would ONLY use that statement if I was out at an event and did not want what I send out published on the Internet (person or confidential traffic) I would use it. So what does having RF only do improve station reception if the stations are in the middle of the 4 fill in's you mention? Is this not a situation where a direct path or digi path only not come it to play? Most fill in station's are set to RELAY,WIDE1-1... why would or should they be using either of those if they direct contact or a reliable direct connection digi to use? IS that not the whole point in the idea of a fill in... mobiles and help stations who do not have a good path to a digi?

**When I say we run RFONLY, I mean RFONLY and nothing else. No digis period. The reason we do that, is here in McMinn County, we see our acks being ping pinged all over the place by the ack going thru a Igate when it is not needed. Why have 6-10 transmissions of the same ack from differnt places when only one is needed? The RFONLY keeps traffic down, and the frequency more open.

I know a lot of us hear have a single hop set up for beacon and message paths so we have a local coverage area only or at least in theory.... unless we are mobile then run a RELAY,WIDE1-1 path... I am wondering why we need more than the local area unless something is happening and need the greater range... for messaging. WX4MRX is set to WA4KJH-7, WIDE2-2 so it can be seen and heard at the greater distances... unless that is too much on the RF side.... then try to use a I-Gate?

**If you are running a path without RFONLY or NOGATE in it, it hits the Igates anyway. You could point the path to an Igate, but that is really not needed, as it happens anyway.

BTW.. where was the message going and what paths where you trying.. I find that interesting... the beacons seem to always make it up here....just like clock work..... and Kevin and I and can almost always go direct to each other? Did you not try Kevin's fill in to my fill in to get he message out to WA4KJH?

**We tried a lot of differnt paths and digis. There are times we do not see Knoxville area station beacons, although we know they are there. I'm not going to disclose who the station is, as he is a new ham, and I don't want him attacked.

**I'm not trying to upset the "apple cart". Everyone is certainly at their liberty to do as they please.

**Flame filter is off..have at it.

**Scott NA4IT

I would like to understand a bit more about the situation that you describe below. Can you elaborate? and maybe give a few examples?

Thanks
William

Our area is currently in a growing period. With all growing, there are growing pains.

As each new digi is brought on line, existing digi's need to be re-evaluated.

If someone sees two digi's that have a significant overlap in coverage, I think it is a good idea to bring this up for discussion.

From what I see (and I only see a small portion of what's going on), I do not currently see any duplication of efforts except where a fill-in digi will hear a packet that is also heard by WA4KJH-7. This is the nature of a fill-in digi and really can not be avoided. If everything that fill-in hears is also heard by a WIDE digi, then the fill-in digi is not needed, but I think (and please correct me if I'm mistaken) that the digi's we have now are primarily in areas where there are holes.

I think our recent discussions about correcting paths has lead to a general path cleanup in the area. I have not recently seen anyone with RELAY or WIDE1-1 anywhere in their path except the first position. If you see anyone using a path that you think is not correct, I would suggest that you contact that person directly and ask them about it. If you are not comfortable with doing that, contact me; I would be happy to talk to someone to help them improve their settings and thus our overall network. Keep in mind, that some people use an odd path for a reason, so don't tell anyone they are doing something wrong untill you understand why they are doing what it is they are doing.

What are the chances of collaborating on a coverage map that would help all of us better understand what areas are well covered and where there are holes?

This is getting way to funny. I hear you all say over and over that the network is saturated. Have you all not been to the Hamvention when thousands of APRS stations were present? I don't believe this to be the problem in the least. I carried on an APRS conversation with WA4BDS while I was parked in my driveway in Chattanooga. We had no problem keyboarding many more miles apart then you describe Scott. Perhaps something was wrong that evening, but I see stations coming from Geogia all the time and that's way south of your neck of the woods.

Topic: 1265 Message: 1277

By the way, at no time, in any of my posts, have I ever said "over and over that the network is saturated". Do not quote what isn't there.

I'm saying we had a problem with two stations being able to communicate. Fact, not fiction. Several things were tried on this end. Nothing worked. Fact, not fiction.

Could a station in this area send an object that MRX could see in a Skwyarn event? Probably not. If a message that is repeated multiple times won't go through, an object that is sent one time probably won't either.

It's not a problem for me. Our voice repeater we use talks directly to Morristown. I can tell them 522 County Road 783 on voice. No biggie.

Enough said. Evidently there is no problem. So I don't have anything to complain about. So I'll just shut up.

Scott, believe it or not the object will probably get through where a message will not. This has to to do with TIME. A transmission that sends an object is rather short in duration because it's total byte count is low. Where a message has a longer transmit time because the byte count is normally larger due to sending a much longer string of data (80 to 120 characters of text). A longer transmit time needed for a message is a much larger target for interference and collisions than the much shorter object transmission.

Is there a problem with network loading in East TN?? Don't know off the top of my head. This would be a problem of Relativity. Meaning its relative to the location of the receiver that needs to hear the transmission. Short answer, if you turn all the digi's off in North Georgia (North of Atlanta), then NO there is no saturation problem in East TN as far as KJH-7 or any other High profile digi in East TN is concerned. However, most of the time the stations in the valley are transmitting at the same time the digis in other parts of the receivers footprint transmit and there is a collision.

Come on guys this is radio, you have to think in 6 or 7 dimensions to figure out some of the problems.

From: David Hoffman
Topic: 1265 Message: 1279

The fact the "network is saturated" was implied in your message. It's the same implied message many posts ago that spurred the discussion of fixing WA4KJH-7's receiver. It's also the same reason that started the discussion of why there are so many dupes out there and why we should not run this or that for our paths, the network can't handle it, just to name a few. I just don't believe it's the network at all. I believe it has to do with our configuration and the way we use it. Don't get me wrong, we all are learning here. But I don't think we are saturating the network at all.

I don't want to see anyone turn off their digi because they are presenting too many packets into the network. Sure we can tweak our stations, but no single digi is causing so much traffic that other stations can't communicate with other stations because of the network. There is just too many variables here but one isn't our network. Listen to the audio for awhile and you'll hear quiet times in there quite a bit. A saturated network would be packets stepping all over each other and hardly no quiet times at all.

1280. Re: Question that may get me shot

Yahoo group: EastTNAPRS
Date: 2006-01-15 03:13:00 UTC
From: William McKeehan
Topic: 1265 Message: 1280

I initially wrote a long message in response to this, but I think it would be better if I just give the highlights.

I agree. The network in East TN does not appear to be saturated.

Regardless, duplicate packets are un-necessary and we should take steps to reduce (or eliminate) them.

Personally, I like home stations being configured to have their stations digi'd by only one WIDE area digi. I like mobiles to be configured to take advantage of the fill-in digi's, then one WIDE area hop. Why? With this configuration, the definition of the local area is defined by the general coverage area of the local WIDE area digi. I also like IGates that are configured to only serve their local area - that is via a single WIDE area digi.

I think many people disagree with me. As a result, the local configurations do not match my recommendations. Would "the network" work better if everyone followed my recommendations? Obviously I think so, but I've never seen it tried in the real world, so I maybe completely wrong.

Whatever the answer, the local APRS network needs to be configured to support communications in the local area. If it's not doing that, something needs to be changed.

Do I think we need to turn any of our existing digi's off? Maybe. But since I only see my slice of the RF, I can't make the decisions for other digi operators.

Do I think that some people are using un-necessarily long paths? Certainly.

Does my station fall into either of these categories? Sometimes. More so in the past than now. The more I learn, the more I reduce my packet count.

Well, I've already said more than I wanted to in this message, so I'll stop here.

As always, these are my opinions. Those of a simple no-code tech. Take them for what you will.

Well, first I am blamed with saying the network is saturated, and now that I said something was wrong with WA4KJH-7's receiver? That is news to me.

John, did I ever say anything was wrong with your receiver? I don't think I did, If I did I apologize.

Anyway, if it makes you feel better, blame it ALL on me. I can take take it!

You know, when we all did the bike ride together, I thought this was a pretty good group to work with. I am begining to have my doubts.

1285. Re: Question that may get me shot

Yahoo group: EastTNAPRS
Date: 2006-01-15 05:03:13 UTC
From: Scott
Topic: 1265 Message: 1285

I went back and looked up message post # 1 for this group. And here is what it says:

"Thanks for the invite to join the E TN APRS group. I hope to learn and share a lot about APRS, and we hope to have a digi full time in McMinn Co sometime this year!

My personal station (which is not 24/7 yet) uses UI-VIEW32, a AEA PK-232MBX TNC, and sometimes is hooked up via the internet direct.

We have some club and area events coming up this year where APRS would be a big help, and will share those events here. Might even ask for some help!"

And do you know whose post that was? Mine.

I still stick by the comments I made in that very first post. All I have ever tried to do is offer suggestions that might help the E TN APRS system. I know I do not have all the answers. But, sometimes, someone from outside the area may see something different on screen that is not seen in someone else's area. When I do see that, I will bring it to the group to look at. And I will usually present it in a generic kind of way so as to not place blame on anyone, but for all to take a look at themselves and those around them, and then if they see something might need to be changed, then they can make that call.

I have always been open to suggestions on KF4CFO-7, and have tried to implement those I thought could really help out. I have also canned some ideas I had because of what I learned here. I try to teach those in our area how to set up a good APRS station, taking into account the type of equipment they will be running, their location, etc.

So if I have offended by my comments, my apologies. If I need to leave the group, I will gladly do so. If my comments are welcome, I will stay. Even if I leave the group, any APRS user may always feel free to email me about the operation of my station or KF4CFO-7, and I will take their comments under advisement.

1289. UX-6 Balloon Launch

Yahoo group: EastTNAPRS
Date: 2006-01-16 02:59:15 UTC
From: William McKeehan
Topic: 1289 Message: 1289

The UT Amateur Radio Club has another balloon launch currently scheduled for Saturday, January 21.

An APRS tracker is planned to be on this balloon and it will be recovered.

So warm up your APRS mobile gear and have fun with the chase.

More details will follow this week; see:

http://balloon.utarc.org for the latest.

1290. On the net tonight

Yahoo group: EastTNAPRS
Date: 2006-01-16 03:08:20 UTC
From: William McKeehan
Topic: 1290 Message: 1290

On the net tonight, we had a good discussion about UI-View and mapping software. If you were not aware, UI-View can be used with Precision Mapping and give you the ability to scroll and zoom maps real within UI-View.

It was also mentioned that UI-View can be used with Street Atlas and give similar functionality. This was not discussed in detail on the net, but it was pointed out that in the Help Index there is an entry "Street Atlas Virtual Map" which gives details on this functionality.

We had a grand total of 16 checkins on the net tonight. I think we had some good discussion, answered some questions and helped some people trying to get their APRS stations up and running.

William

1291. New Members

Yahoo group: EastTNAPRS
Date: 2006-01-16 03:12:44 UTC
From: William McKeehan
Topic: 1291 Message: 1291

In the last 7 days, we have had 7 new members join this group; some of them joined just after the net tonight.

I want to say welcome to all. Feel free to jump in, ask questions and share your APRS experiences with the group.

If anyone knows of someone active wth APRS or looking to get involved in APRS who is not a member of this group, please extend them an invitation to join this group. This group is open to all; approval is required, but that is only an attempt to prevent SPAM from getting into this list (so far, knock on wood, it seems to be working).

The help file is correct that this is a very clunky way of moving around the Street Atlas Map within UI-View32. It does it, but you still can't box in an area and zoom into that boxed in area. I just wonder what this would be like while trying to chase a balloon? I do like APRS+SA for this purpose. It makes chasing a balloon so much fun.

1293. OpenTracker Project

Yahoo group: EastTNAPRS
Date: 2006-01-16 03:39:06 UTC
From: David Hoffman
Topic: 1293 Message: 1293

I ordered an OpenTracker kit yesterday from N1VG. I'm looking forward to building this kit and getting it on the air. The one thing that I liked about the OpenTracker over the TinyTrak was the feature that will stop all transmissions once the battery voltage reaches a preset level. Perhaps I'll never have any more dead batteries again.

My plan is to leave this in the car full time and get the APRS tracker box out of my car. I want to redo the tracker box into something like an ammo box and make it smaller. I also want it to be a portable box I can take with me without removing the one in the car. This way the car will always be on the air and I'll have a portable setup as well. This way I can do APRS demos allot easier too. If this works well, I'll build another OpenTracker for the other car too.

There is a zoon function in UI-VIEW although I sure not as fuctional
as UI-VIEW with Precision Maps of other APRS softwares.

To zoom an area, Hold the shift key down, left click the mouse in the
center of the area you want to zoom, hold the left mouse botton down
and drag the box or circle.

Right click and select close to quit zoom.

From: William McKeehan
Topic: 1290 Message: 1295

I have similar zoom capabilities that you have in Xastir; completely different maps, but similar zoom/pan capabilities. When chasing a balloon, I often have Xastir up AND Delorme Street Atlas up; I use Street Atlas to determine my route to intercept and Xastir to see other stations.

The biggest issue that I have with APRS+SA is that it does not support the newer versions of Street Atlas. If it worked with the new versions, I think I would be using it. I do have it installed with SA 7 (I skipped 8 and 9, then have about 3 more recent versions).

Using Precision Mapping with UI-View may be the solution, but I don't know if you can do the routing type things that you can do with APRS+SA with UI-View/PM.

1297. Fill-In Coverage

Yahoo group: EastTNAPRS
Date: 2006-01-16 23:01:31 UTC
From: William McKeehan
Topic: 1265 Message: 1297

I just added a screen shot to the Photos section of this group. It is an estimate of the coverage of the fill-in digi's.

Based on my experience, this image gives a pretty good picture of the overall coverage by the fill-in digi's, but remember it's an estimate derived from estimated numbers (HAAT/Power/Gain for each fill-in) and tries to give you an idea of where a 5 watt mobile station would be heard by the fill-in digi's.

Have a look and let me know what you think.

NOTE: WA4KJH-7's coverage is not depicted on this map, only the fill-in digi's.

There are several ways to zoom in and out....The easiest is the use the Alternate Mouse functions... it reverses the the options... to zoom all you do then is LEFT click on the screen, hold it down and you get a maginfiying glass. Make the square as big or as little as you want... this will determine the zoom area... really nice feature.

William,
Could you plot the coverage for the new digi I am putting up above Lake City. Ele 3200ft asl, erp at the antenna 24.17 watts (5 watt trx with 9dbi gain antenna). Just wanted to see what the footprint might look like.

From: Greg Williams
Topic: 1265 Message: 1304

Just this morning I'm seeing a whole bunch of Winlink stations appear on the map, even though I'm not connected to an APRS server (RF only).

Can someone advise of how this is being accomplished?

Some of the stations I have include:
WB9F-WL - MO
K7BC-WL - VA
N3LJZ-WL - PA
NG3F-WL - PA
KN6KB-WL - FL
W1GRF-WL - NH

Also, I noticed Atlanta/North GA started populating more than normal. Did a new digi open up from that area?

1307. My APRSlink Evaluation

Yahoo group: EastTNAPRS
Date: 2006-01-17 16:08:51 UTC
From: Scott
Topic: 1307 Message: 1307

Having been a user of the MARS Winlink system and the Amateur Radio side of Winlink also (and the AirMail2000 software), when I saw the bit about APRSlink, I decided to check it out. So I sent a message to a friend, and one to my self, the sent a return message back to myself thru Winlink to my APRS station.

What do I think?

Well, it is very clunky at best. The format to send a message is like the keyboard to keyboard mode we used in MARS in that you have to input address, hit enter, subject, hit enter, line 1, hit enter, etc,etc,etc (they since have learned to use AirMail2000, I wrote a guide for TN ARMY MARS users on how to set it up.)

The message I sent to a friend did not fully get there (address, subject, no body). The one to me went OK, but the return to my APRS station didn't really come back formatted well. It also took some time for the individual lines to come in.

And, if you do like I did, and forget to strip off your signature attached to the bottom of the email, along with the original message, then the message takes forever (YES, that was ME tying up the network for 15 minutes around 11AM!)

My opinion?
Winlink is better left to VHF Packet or HF Pactor. The HF Pactor is the better choice, because this mode has error correction, and the massages go and come as in email format.

I really don't think APRSlink will "fly".

From: William McKeehan
Topic: 1307 Message: 1308

I will basically agree with you with one exception.

For someone like me who is only an occational WinLink user, it's handy to be able to see if you have any e-mail on WinLink by using APRS. Since it has become available, I have frequently sent the message "L" to WLNK-1 to see if I need to start up the Paclink software and fetch my mail.

I guess if you're in an area that has APRS, but no telpac nodes and no internet access and only VHF equipment or privilages and have urgent communications that you need to send an e-mail about, this APRSlink would be a nice option to have available. But I agree with you...it seems of very little use really.

From: Scott
Topic: 1307 Message: 1309

Additional info on APRSlink:

To actually send a message, here is what you have to do:

Set your "TO:" for WLNK-1.
Set your "Digi" for a resonable path to an Igate.

Here is the message format:
(All these lines are typed in exactly as shown here, with the exception for adding your own addressee, subject and text without the quotes, keeping each line to 66 characters, including spaces, etc.)

W "email address" (hit enter)
W1 "subject" (hit enter)
W2 "first line of text" (hit enter)
W3 "second line of text" (hit enter) You keep adding W# for more text.
/EX (hit enter) Ends the message.

As each line is sent, it waits for an "ack" before the next line is sent. If a line doesn't receive an "ack", then the next line is sent without the previous line going to the addressee.

See what I mean about "clunky"?

AND, there are other commands you have to learn to be able to "check" and "read" your messages.

With standard HF Pactor Winlink (AirMail2000) you have a window that looks very similar to Outlook Express, and everything is formated like an email. The Pactor treminal window does the automatic hookup, send and received for you, and drops any incoming messages into your "inbox" in the message window.

Just my take, thought I would give a little more technical explanation for those interested.

1313. Question on WX Beacon timing

Yahoo group: EastTNAPRS
Date: 2006-01-19 05:04:35 UTC
From: Scott
Topic: 1313 Message: 1313

One of our local hams here in McMinn Co is getting into APRS, and plans to setup his home station the transmit data from his WX station 24/7.

What is the "recommended" beacon timing for the WX? I was thinking 30 minutes on good days with no bad WX, 15 for bad days...

Side note: glad to see this ham doing it. I think it is something that MRX may find useful in McMinn Co.

1315. UX-6 press release rough draft

Yahoo group: EastTNAPRS
Date: 2006-01-19 14:15:47 UTC
From: William McKeehan
Topic: 1315 Message: 1315

FYI: DRAFT (subject to change) see http://balloon.utarc.org for the latest information.

Attention all radio amateurs:

The University of Tennessee Amateur Radio Club (UTARC) is preparing to launch a weather balloon radio experiment on Saturday, January 21, 2006. Launch time will be approximately noon Eastern Time, or 1700 UTC.

The designate for the balloon will be UX-6, and will contain APRS and voice telemetry readout on 2 and 10 meters. Chase and recovery of the balloon is planned.

The purpose of this mission will be to test out equipment that either did not function on previous flights, or was pre-empted due to time and payload restrictions. This will be a relatively low-altitude flight lasting less than one hour as a cut-down device is also planned for testing.

Below are the specifics set forth for UX-6:

Date: Saturday, January 21, 2006
Time: Noon Eastern Time, 1700Z
Location: Island Home Airport, Knoxville TN
Estimated payload weight: 4 lbs
Balloon size: 300 grams
Frequencies: 2m - 145.600 MHz voice and APRS / 10m - 28.625 voice
Power: 2m - 2w / 10m - 800mW
Expected altitude: approximately 35-50k feet depending on payload weight

Planned Payload:
Video camera (no live downlink) - may take MPEG video of entire flight GPS
Thermometer
APRS TNC
2m and 10m transmitter
Cut-down device for detaching balloon from payload train.

To submit your report, please go to the online submission form at http://www.utarc.org and submit your information.

Please make any suggestions and/or corrections by noon Thursday.

1319. Re: OpenTracker Project

Yahoo group: EastTNAPRS
Date: 2006-01-19 21:02:05 UTC
From: William McKeehan
Topic: 1293 Message: 1319

I'm looking forward to hearing your report about this kit. I think
the OpenTracker is some interesting competition to the TinyTrak and
it has some features not available in the TinyTrak.

For anyone interested, N1VG has a web site all about the OpenTracker:
http://n1vg.net/opentracker/

Then he has a store for some of those not-so-easy-to-find hardware
items related to APRS:
http://www.argentdata.com/catalog/

Trying to keep the competition going, the TinyTrak team has an
updated version of the TinyTrak3 called the TinyTrak3Plus.
http://www.byonics.com/tinytrak/tt3plus.php
You can get one of these built and tested with a GPS for under $110.
Something to consider for putting a tracker in a vehicle; all you
have to provide is the radio.

Hello,
I currently own a non operational TH-D7 that I am trying to get back on the air. At some point soon I also hope to purchase a TH-D700 for a mobile. I also discussed using a sound card set up with Roy at our meeting this past Tuesday.
In the past I have used WinAPRS, I think the last version was 251. It has been a couple of years since I was on the air. I'm sure I will be looking at other software packages as well.
It's good to see all the traffic on this group.

1325. UX-6 Balloon Launch Saturday - NEW LAUNCH TIME

Yahoo group: EastTNAPRS
Date: 2006-01-20 04:05:39 UTC
From: Greg Williams
Topic: 1325 Message: 1325

Attention all radio amateurs:

The University of Tennessee Amateur Radio Club (UTARC) is preparing to launch a weather balloon radio experiment on Saturday, January 21, 2006. Launch time will be approximately 2 PM Eastern Time, or 1900 UTC.

The designate for the balloon will be UX-6, and will contain APRS and voice telemetry readout on 2 and 10 meters. Chase and recovery of the balloon is planned.

The purpose of this mission will be to test out equipment that either did not function on previous flights, or was pre-empted due to time and payload restrictions. This will be a relatively low-altitude flight lasting less than one hour as a cut-down device is also planned for testing.

Below are the specifics set forth for UX-6:

Date: Saturday, January 21, 2006
Time: 2PM Eastern Time, 1900Z
Location: Island Home Airport, Knoxville TN
Callsign: AA4UT
Estimated payload weight: 4 lbs
Balloon size: 300 grams
Frequencies: 2m - 145.600 MHz voice and APRS / 10m - 28.625 voice
Power: 2m - 2w / 10m - 800mW
Expected altitude: approximately 35-50k feet depending on payload weight

Planned Payload:

Video camera (no live downlink) - may take MPEG video of entire flight
GPS
Thermometer
APRS TNC
2m and 10m transmitter
Cut-down device for detaching balloon from payload train.

To submit your report, please go to the online submission form at http://www.utarc.org and submit your information.

Yahoo group: EastTNAPRS
Date: 2006-01-20 22:29:15 UTC
From: kf4qvi
Topic: 1317 Message: 1328

David,
It powers up and receive's with no problem. It hears the traffic on the APRS freq just fine as well, (stations, digi's, ect). But I have not been able to get the transmit working. I first thought I had made a mistake with one of the settings. But after doing a system rest on it and starting over, I still get nothing. I have not messed with it in sometime, but charged it last night and hope to start fooling with it this weekend and maybe make some progress. I will keep you posted.
You are welcome to take it and look it over if you'd like.
Thanks
Rick

1329. Re: UX-6 Balloon Launch Saturday - NEW LAUNCH TIME

1330. RE: [EastTNAPRS] Re: UX-6 Balloon Launch Saturday - NEW LAUNCH TIME

Yahoo group: EastTNAPRS
Date: 2006-01-21 01:10:36 UTC
From: Travis J. Maclay
Topic: 1325 Message: 1330

Scott,

You are correct that 145.600 will be the balloon's APRS frequency. The reason for this is so that the balloon has a relatively clear frequency to xmit every 15-20 seconds without collisions. It does work best if no one is transmitting on 145.600 during the flight of the balloon so that the balloon has a clear frequency and that all packets can be heard as clearly as possibly.

In reference to the digi's needed, nothing should be needed as the balloon has a huge altitude advantage and most all of us should be able to hear the balloon direct after it reaches a couple thousand feet.

If you are running an Igate, it would be nice to have your radio setup if possible to listen only on 145.600 and gate to the internet. I know that KI4HDU is planning on doing this as well.

Thanks for checking on this!

Travis

1332. New APRS user in Athens TN, WA4JTD

Yahoo group: EastTNAPRS
Date: 2006-01-21 01:44:09 UTC
From: Scott
Topic: 1332 Message: 1332

Well, I have been working with Lynn, WA4JTD to get his APRS station up and working.

He is running a RS HTX202 at 5W, AGWPE w/ UI-VIEW32, and a Weather Channel / Lacross WX station w/ UI-Weather software that takes the data from Lacross' Heavy WX and send it to UI-VIEW32. We will be adding a TNC shortly, instead of the AGWPE.

We had a bear of a time getting the interface (Buxcom) to work. Lynn's computer only has one serial port, and the WX station has to use it. So we opted for using the parallel port to do the PTT for the interface. The problem was, the port did not produce enough voltage to fire the PTT LED and the optoisolator at the same time. We had to bypass the LED. Also, the RX audio just would not do right through the interface isolation transformer, so we built a straight cable, and left the interface to do the TX and PTT.

To use the TNC, we are going to get a USB to Serial adapter (if anyone has suggestions, let me know!).

Lynn is committed to doing this as a 24/7 operation. He is going to put up a ground plane to operate through, and will be WIDE2-2 every 15 minutes, so the WX data will stay "fresh". He usually beacons thru KF4CFO-7, but many of us here can get him direct, even with the 5 watts. He will be on RF only as he has only dial up internet, and is not a big user of it.

This is a welcome addition to Skywarn in the McMinn Co area.

You can find Lynn (WA4JTD) right at (or behind!) KF4CFO-7, or on the internet at http://wx.findu.com/wa4jtd.

Also Scott, another reason for the clear APRS frequency of 145.600 is that the balloon will also be speaking out position reports as well on that same frequency.? So if you want to also turn up the audio on your radio, you can listen to the payload speak as well.

1338. New to APRS

Yahoo group: EastTNAPRS
Date: 2006-01-22 02:35:33 UTC
From: Matt
Topic: 1338 Message: 1338

Hello!

I am new to APRS and am looking for a cheap way to go mobile. I have found the Tiny Trak, but it looks like it nickle and dimes you to death. Any ideas? Any where local I can get the TNC I need? All I need is a transmit only TNC. I already have a GPS and radio for the job.

Thanks and 73,

Matt

From: William McKeehan
Topic: 1338 Message: 1339

I have the TinyTrak3 and have found it to be a very handy device for transmit only.

As for a "real" TNC, I would look at the "Packet Radio USB micro TNC Plus" (http://www.elcom.gr/). They have 2 options, one for under $100. I do not have any personal experience with these, but the price seems right.

You can also look into the TNC-X (http://www.tnc-x.com/); at under $50 bucks it's very inexpensive (I think that's a kit). I think N4CQW is using one of these.

Then there's the "gold standard", the KPC 3+ (http://www.kantronics.com/products/kpc3.html); it's more expensive, but certainly full-featured.

You say that the it looks like the TT3 "nickle and dimes you to death"; why do you say that? Where are you seeing the nickles and dimes?

1342. Need help in Upper East TN to find UX-6

Yahoo group: EastTNAPRS
Date: 2006-01-22 05:59:17 UTC
From: Greg Williams
Topic: 1342 Message: 1342

Well, UX-6 locked up and stopped transmitting data about 30 minutes into it's flight. Projections say that the balloon could have landed in an area from Mountain City, TN, northeast of Tri-Cities, to Extreme Upper Northwest NC, and into VA in the forest area.

If you hear packet on 145.600, or a quick keyup beacon on 433.990, then please contact us. We believe the balloon to be in this area.

If people in this area could be alerted, that would be appreciated.

http://balloon.utarc.org is the web site to contact, or send an email to me at this address.

Greg Williams, K4HSM

Can you elaborate on not using the same radio for voice?

How does the TNC-X connect to the Radio? Is that connection different than a "normal" TNC?

What I mean by "nickle and dime" is the connections, like the power cord and cables to connect the radio. I am not very knowledgable in the APRS so maybe I am missing something?

Interface cables can get costly.? Really depends on which radio you have and what you are connecting up.? There are allot of hams who I bet would be glad to build some of those cables for you.? The only difficult part sometimes is duplicating some of those special ends that some equipment are using these days.? Like I said, this really depends on your radio.? If it uses something pretty standard, surely someone can solder up some interface cables for you.

1351. Winlink 2000 TELPAC node

Yahoo group: EastTNAPRS
Date: 2006-01-23 00:30:10 UTC
From: Jeff Yawn
Topic: 1351 Message: 1351

Just for everyone's info I have my TELPAC node back on line for those of you intrested in Winlink 2000 email capabilities. It is on 145.050 under the call KF4UVT-10. If you can not hit it direct you should be able to get to it from RACES2 or ENGMTN.

Hope to also have my packet station back up full time this evening.

I have spent most of the day re-configuring everything to get all this stuff working at the same time.

3 TNC's 3 radio's and finally enough serial ports for everything.

Looks like UX-6 is lost?

Jeff

Balloon was launched at 6:15 pm this past Saturday from Island Home Airport in Knoxville. The balloon was not recovered and remains MIA at this point in upper east Tennessee, upper west North Carolina, or lower west Virginia.

More details on this balloon and all others can always be found at balloon.utarc.org as well in the forums section at forums.utarc.org.

Well, for the last few days, 144.390 has been wide open. I have regularly seen stations as far away as Beckley, VA, Birmingham, AL, Macon, GA, and Evensville, IN. This morning, I was RXing a digi in E TX through W4LAW-3 in Soddy Daisy! (One hop, period!)

Right now, I have 8 stations in my list. None are directs. I see NO Knoxville or Atlanta area stations at all. I barely can hit KF4CFO-7. I cannot even see Kevin, KF4YMC, who is only 15-18 miles from me, and he cannot hit KF4CFO-7 at all!

Very wierd!

It looks like you are set for hardware; all I would add would be a computer and some software like UI-View32 (www.ui-view.org) and some cables to go between the computer and the TNC and the TNC and the radio.

APRS seems to be one of those things that can catch on pretty quickly. All you need to monitor is a computer, some software (free), and a receiver. To transmit, you need a little more, but not much. So getting started can be easy. Going mobile requires a little more (a GPS generally). Once you get your setup working, you'll have to show it at some of the local club meetings and see if you can get others interested.

There have been some efforts to use APRS data to identify VHF propagation. One website that I know of is this one: http://mountainlake.k12.mn.us/ham/aprs/

I did not look at it earlier in the week, but today it shows no activity. It may be out of date too.

Using APRS technology to identify VHF propagation has other advantage too...check my next post on something called HamIM...

From: William McKeehan
Topic: 1361 Message: 1361

HamIM (Ham Instant Messaging) is a variation of APRS that is customized to be VHF Contest friendly and ARRL Contest Desk approved! Participants use APRS technology, but on 147.585 MHz (the highest 2m simplex frequency in the ARRL band plan) rather than 144.390 MHz. The difference is that all operation is simplex (no digipeters). This requires only minor setting changes to the APRS software used.

If you are into VHF Contesting, this may be something to look into.

http://w2ev.rochesterny.org/HamIM/HamIM.htm

Thanks to John, K4UAE, for telling me about it.

William

Stephen,

Put up a good hi gain antenna. 3 of us in McMinn Co use HT's as our
TXRX. I am using an old TEN TEC that has no tones.

1367. New Map - Downtown Knoxville & Knox County

Yahoo group: EastTNAPRS
Date: 2006-01-26 00:34:04 UTC
From: submix
Topic: 1367 Message: 1367

I made a UI-View map yesterday since it was helpful for me in the areas I travel. Not sure if anyone else will like it, but works for me and thought I'd share it.

And by the way, I've got MapPoint which was used to make this map. If any of you need a map of a certain area that is zoomed in or out, let me know the boundaries of what you're looking for and I'll be glad to create the image & INF file for you and place on here.

73,
Travis
N4TJM

BTW - The file is called UI-KNOX.zip

From: Scott
Topic: 1368 Message: 1368

He guys,

I needs some info on a Kantronics "KAM" only (not a plus, but the old one.)

If someone could send me a scan out of the Installation Manual of the jumper locations and settings that would help.

Also the wiring diagram and jumper setting for the KAM to a Yaesu FT-51R (or similar set up) HT would help.

Trying to help a fellow ham get setup on APRS.

Thanks, Scott NA4IT

William, KI4HDU

Thanks for the invitation to join the group. I've operated a fixed unmanned station for about 8 years and support area events as a fill-in digipeater.

My experience was initially with PACTERM and currently with Brent Hildebrand's APRS+SA and Street <http://www.tapr.org/~kh2z/aprsplus/> Atlas v.5 software which works great with a Kantronics 9612Plus TNC. I'm still learning all this package will do and certainly no expert by any means. Great article on APRS in Feb 06 QST. Lots of suggestions to help with ping-pong and duplication of packets by modifying paths. From where I'm located I (one) hop to WA4KJH-7. My altitude is ~1150ft ASL and have wide direct coverage.

When I connect to the internet.it sure can get busy in a hurry so I normally limit my range reports to 300miles and Local RF Only. When I expand to 3000miles, North and Latin American are saturated with APRS stations many being WX. Also, the UTARC balloon flights have created quite a stir in the APRS arena lately and a lot of HAMs are now interested.

My affiliations are with ARRL, SMARC, and SKYWARN.

Enough about me.

Hey Tom! Welcome to the group.

I have not seen the article in QST, but I suspect that it may cause
some confusion in our area.

The big digi in the area, WA4KJH-7, is not yet configured to respond
to WIDEn-N, so if you want to be digi'd by him, you'll have to
use "WIDE" or WA4KJH-7 specifically.

We have many stations in the area now, and several right around you.

Feel free to post questions or comments to this group and again,
welcome!

William

I am currently using [WA4KJH-7*,WIDE1-1] which seems to work well. The thrust of the QST article is centered on operators

still using TRACE, RELAY, and multiples of WIDE.

From: Tom
Topic: 1380 Message: 1384

William, KI4DHDU,

Most recently the UTARC balloon flights primarily in the background as a fill-repeater. Locally, the 5k-10k runs. Most of the time it just sits here monitoring and repeating what it hears. Severe weather is another that I monitor and now take a more active part in reporting. David Hoffman KE4FGW announced at our last SMARC meeting he is tasked to provide support for the next KTown race in March and is soliciting 2M communicators and I suppose APRS help also. I've not committed to assist yet since I don't know if I will be in town. Being retired, we tend to travel in Feb and Mar.

I can see an expanded role for APRS in search and rescue. With recent technology changes, (small portable units) would easily fit in to local plans to include amateur operators. A wide local network would enhance the overall operation.

Can you tell us about some of the events where you have used APRS?

I think APRS is a great thing for events; it answers the one question that seems to come up most often - "Where are you?"

William, APRS is alive and healthu in the Tri-Cities and has been for a number of years. I started when there was nothing going but DOS and have always tried to help anyone interested.
A few months ago we lost our long running site on Holston Mtn due to bad politics in Carter County. We have recently acquired a real fine site and W3FXO, W4EHI and I visited it for the first time today. It will take us a while to get the antennas up for both APRS and a 145.01 packet node. This is a super big commercial tower, with nothing much else on it, and we have to dig up different antenna mounting brackets. The site is about 3900'+ absl. Hopefully this will get us into WX4MRX and WA4KJH-7.
Please feel free to direct anyone interested to any of us.

73,

Charlie K4ITV

p.s. N4ZDG-5 is my Grandson and the fill-in digi there belongs to me.

1387. UI-Radar update info

Yahoo group: EastTNAPRS
Date: 2006-01-30 20:09:06 UTC
From: Scott
Topic: 1387 Message: 1387

The gif images we have been using for UI-Radar from the NWS websites have been discontinued. I have not tried to use the newer radars to see if it will function. I do know the new "Ridge" radars WILL NOT work.

I have found that UI-Radar has a bug in it, and here is the example of what happens:

Load UI-VIEW32. (and auto load UI-Radar)
Switch to a radar map.
UI-Radar begins to update it.
Sometime later you switch to a different map while UI-Radar is updating the radar image.
One of two things happens...the radar image becomes corrupted, or the map you are loading becomes corrupted.

The only way i have found to get rid of the corrupted file so you can redo a new one is to delete the file in DOS. Windows will not delete it, as it gives the "file in use" warning.

I have stopped using UI-Radar, as it is just as easy to switch to a radar screen on the internet, and I like the UI-NWS on APRS better anyway.

(William, I went ahead and deleted the NWS Radar files from the group to lessen confusion.)

Does UI-NWS allow you to overlay radar data on other maps?

Give me a few days, Bob KC4URW has one that he is using and I can most likely get you the information... the thing is he is in Charolette NC this weekend for work... the next time he should be home is Monday evening.

I have cc'ed hims ohopefully he has the manual handy still so I can get you the info.

73, Good night, Moe

On 1/27/06, Scott < na4it@...> wrote:
He guys,

I needs some info on a Kantronics "KAM" only (not a plus, but the old one.)

If someone could send me a scan out of the Installation Manual of the jumper locations and settings that would help.

Also the wiring diagram and jumper setting for the KAM to a Yaesu FT-51R (or similar set up) HT would help.

Trying to help a fellow ham get setup on APRS.

Thanks, Scott NA4IT

Congratulations on getting the TT3!

I have added a screenshot of one configuration I often use in my TinyTrak3 to the Miscellaneous Photo Album in Photos section of this group (I think this link will take you directly to it): http://ph.groups.yahoo.com/group/EastTNAPRS/photos/view/1fa6?b=5

The path that I would recommend is the same as what I am using in the screenshot: RELAY,WIDE. This recommendation would change if you travel out of the Knoxville area, but should work well around here, even with just 5 watts.

You'll have to explain a bit more about this statement: "I also need to know why I am not beconing out except when I plug it up." I'm not sure what the issue is and what you mean by "plug it up"

From: William McKeehan
Topic: 1387 Message: 1396

I can totally understand that! having to constantly replace corrupt files is not fun.

Does anyone follow the UI-View group? Are they having any discussion about this unfortunate problem?

To me one of the great values in using APRS for WX watching is being able to overlay all of the data on one map, thus the ability to put the Radar on the APRS screen is important to me.

1397. Sunday Night Net

Yahoo group: EastTNAPRS
Date: 2006-01-31 14:05:04 UTC
From: William McKeehan
Topic: 348 Message: 1397

This past Sunday Night's Net was a record setter.

We had 24 check-ins; 12 via APRS message. And the net lasted until 9:47 (that would be an hour and fourty-seven minutes).

We had some good discussion about:
* which GPS units can be used with APRS and what some of our users recommend
* what is APRS
* why would you run APRS on a daily basis
* OpenTracker vs TinyTrak3
* sending messages from UI-View with an internet only connection

Plus other topics. Overall, it seemed to me like a great net with lots of good discussion.

Please note: if you can't be there at 8:00, but can show up later, please do. The net generally lasts an hour, sometimes longer. If you don't think you have much to add, think again. One question that came up last night was "what is APRS"; a fundamental question, but one that helps everyone listening. I encourage everyone to check-in, ask questions and give their ideas.

I appreciate everyone that participated in the net! It seems to be doing what it was designed to do which is to help people get up and running with APRS.

Topic: 1394 Message: 1400

Maybe I understand now.

When you first power up the TT3, it will send a beacon identifying itself as a TT3. After that, the configuration that you have in place takes over. If you do not have a GPS attached and sending it NMEA sentences, then it may never beacon after the initial power up. If you do have a GPS connected, then it will beacon at the rate specified in your setup.

The path of RELAY,WIDE will get you digipeated by home fill-in stations and one WIDE area digi (generally, WA4KJH-7 in this area). So yes, that is currently the best path for a mobile station in this area.

Well..I am going to power up at 4:00PM as I go to class in West Knoxville. I will be monitoring 146.940..so if anyone sees me on APRS, please let me know so i know my settings are right.

Will the current configuration I have get me on FindU.com or on the APRS servers?

Any packets heard by an IGate will make it to FindU.com and the APRS-IS. WA4KJH-7 is heard by at least two IGate stations, so if your packets are digi'd by WA4KJH-7 (and the settings that I suggested should make this happen), then you should make it to FindU.com.

As for giving you a shout on 146.940...I'm currently in Memphis, so I will not be able to do that; maybe someone else will be watching and will give you a signal report.

OK..I had my tracker on the entire trip to school and nothing worked. I was not recognized on FindMe.com even though I was sending packets out (I could hear them on my mobile radio)! If anyone is available to check and see if I was heard on thier home station or computer I would appreciate it. I was on from 4:00PM tp 5:00PM today. I may have a antenna problem that is causing me not to be able to hit the digi.

Thanks,

Matt

I did not hear you at my home location.

Are you on the correct frequency? 144.39?

There are a couple of pots inside the TT3 that you may need to adjust. One is for the output audio level, the other is sensitivity for the carrier detect network; I found those to be my biggest problems with the TT3 at first.

I also had antenna problems on the Motorcycle.

The next thing I would try is setting up a RX station at your house and see if you can pick it up there and decode the packets.

Let us know what you try and what does/does not work. There are others on this list that have had some experience with the TinyTrakers; maybe they will offer some other suggestions.

1407. Re: [EastTNAPRS] Re: New APRS!

Yahoo group: EastTNAPRS
Date: 2006-02-01 02:57:16 UTC
From: David Hoffman
Topic: 1394 Message: 1407

Even so, it was not tested on your radio in your environment.? The audio still needs to be adjusted to match your radio.? Both pots need proper adjustment.?

TinyTrak3 Adjustment
There are only a few adjustments required for proper operation of TinyTrak3. First, the transmit audio level should be adjusted at R6 for proper deviation. Use the transmit tones buttons (1200 Hz/2200 Hz/Send Both) in the configuration software to cause the TinyTrak3 to transmit while adjusting. When in 300 baud mode, the tones sent are 1600 Hz and 1800 Hz. You can listen on a separate receiver, and start the potentiometer at maximum drive. Lower the drive level until there is a noticeable change in the receiver. Overdriving the transmitter is a common cause of failure to decode.? TinyTrak3 was designed for hand held radios. Some mobile radios require more audio drive than TinyTrak3 puts out. If audio levels are too low, even with the R6 pot set to maximum, consider replacing the 220K R5 with a 100K resistor or
shorting jumper. This should allow for about double the audio range.

The next adjustment point is R9, which is used to adjust the carrier detect base level. This should be adjusted such that Carrier Detect LED is usually off, but turns on when the radio opens squelch. Radio receiver volume should be set to maximum, and the radio can NOT have a constantly open squelch. As R9 is rotated from one extreme to the other, U1 pin 10 should swing from 0 volts to 5 volts.

The last adjustment is the calibration value. This adjusts timing slightly to compensate for ceramic resonator error. Try a few different values while monitoring the decoding on a TNC, and set to the value which gives the best decoding. Usually the default 128 works best.

After setting the desired configuration options, TinyTrak3 should be connected to a radio, GPS, and power supply, and will be ready for use. When power is applied, the carrier detect and valid LEDs should flash three times to show proper firmware operation and proper LED wiring. If carrier is not detected, PTT LED D4 should light for about a second. Power LED D1 should always be lit.

If a radio is connected, it should transmit periodically and a packet burst should be heard on a receiving radio. When the receiver?s squelch is opened, the carrier detect LED should light, and all transmissions will be delayed. If a radio receiver and TNC is available, packets should be able to be monitored.

From: William McKeehan
Topic: 1394 Message: 1408

David is 100% correct.

I have used my "Built-and-Tested" TinyTrak3 with two different HT's; I have to adjust these pots differently for each radio.

These adjustments are not like doing major surgery to the TT3; just remove the one screw holding the case togather, then you'll see the big orange pots. It's pretty easy to adjust. Following the instructions that David provided produced good results with my TT3.

I had forgotten about the calibration value; I did not have to change mine, it worked well at the default of 128.

From: William McKeehan
Topic: 1412 Message: 1412

As many of you know, I'm in Memphis this week for work.

I went out to lunch today. As I was returning to work, I zoomed out my GPS screen connected to my TH-D7 and what did I see but KG4GUL-9, Rick, mobile in the Memphis Area. (KG4GUL's home QTH is in Maryville, FYI). I sent him a couple of quick messages and coordinated a repeater for us to meet on and chat.

Had it not been for us both having APRS, I would have never known that he was in the area.

Love that APRS!

From: William McKeehan
Topic: 1410 Message: 1414

I created a folder in the Files Section and put my settings file in there; I think this is from my PM 3 setting.

Not everything is stored in the file, but the basic settings are.

Have a look...

Biggest "tips" that I can think of:

1. Key Function #3 (Radio Menu #1, Display box, Key Function Pull-down).
I use #3 which gives me the "APRS" soft buttons on the bottom of the display without having to press and hold the F key. So it's one click to see the stations list, position, messages, enable/disable the beacon and to see the packet monitor. Those are the functions that I use most and having them available with one button push as opposed to two is really handy for me.

2. PF key on Microphone to Position (Radio Menu #2, MIC box, PF1 Pull-down).
Since I frequently have the GPS where I can't see it when I'm using the D700, I have set the "PF" button on my microphone to POS. So pressing the PF key on the microphone will show me my speed, location, etc; handy for a quick check or a better speed-o-meter :-)

3. MIC control (Radio Menu #2, MIC box, MIC Control Checkbox).
This lets the DTMF pad on the microphone control various things like enable the tone, turn the volume/squelch up/down. Handy feature for me; page 73 in the manual.

I think other than using Program Memories, these would be my big 3.

You may want to look at the link700 software; especially if you have multiple Kenwood Radio's that you would like to configure similarly (like the D700 and the D7).

http://www.wa3hrl.com/link700/index.html

link700 is a program that will allow users of Kenwood transceivers that support computer data transfer to download all the data settings of their radio, edit and modify data, upload the data, and save settings to a disk file.

Features:

* Support for TH-D7, TM-D700 , TM-G707, TH-F6/7, TS-480 and TS-2000 radios.
* Multiple "profiles" may be opened at a time.
* "Smart Upload" feature. Keeps track of data you have modified and allows you to upload only the data that has changed, a real time saver.
* Data in menus are organized in the same order as in the radio menus, so data fields are easy to find.
* Cut-n-paste blocks of channels. You can move frequencies around within the channel space of the radio -or- copy to another profile. You can even copy from one type of radio to another, e.g. from a TH-D7 to a TM-D700, or vice versa.
* Drag-n-drop channel copying.
* Sort blocks of channels by frequency or name.
* Import frequencies from ARRL's "Travel Plus for Repeaters"*.
* Edit a .file from "Travel Plus for Repeaters"*.
* "Quick" Time Set for TM-D700
* "Quick Message". Type in an APRS message and send it to the radio (TM-D700 and TH-D7).

link700 is offered as shareware. It is totally functional, but has "nag" screens when you perform certain operations. In order to remove the nag screens, it is necessary to register link700; currently $35.

We now have a total of 12 stations in McMinn Co, with a breakdown like this:

(1) Fill-in Digi / EOC station
(5) RF Home stations, with one of those a 24/7 WX station
(1) Mobile
(1) HT
(4) Internet stations (currenty being gated to RF by me during daytime, evening, soon to be gated by KF4CFO-7 24/7)
(I am on dial up...yuk!)

Of the Home RF stations, 4 are run with 5W HT's.

The packet that you show indicates that you were "relay"d via 2 digi's before being heard by my IGate; I'm gating your packet to the internet (the first IGate that hears is will be the only one you see on the internet).

The other two stations that digi you are some unknown station and WA4KJH-7 (based on the RELAY,WA4KJH-7* in the packet below).

Does this help make things more clear?

That wasn't counting my station, was it? I've been off the air for several days. I just happened to be playing with APRS just tonight. I built the OpenTracker a week or so ago and got it on the air tonight. I actually had all three of my stations on tonight.

Nope - your station was not on the air when I sent the earlier note.
Neither was Tom or Moe or...

It looks like for the most part, only one station was hearing and decoding your packets directly...that would be a mystry digi (one that does not use alias substitution), so I have no way to tell which one it is.

Maybe setting the pot to the max position on the TT3 was too much and you need to turn it down a bit; maybe try 75% of max and see if you get better results that way.

Is the TT3 somewhere that you can watch the lights? Maybe the Carrier Detect is too high and you are picking up some noise and not actually transmitting.

Antenna is always a possability...but that's not where I would look first with the data that I'm seeing.

Just a couple of my thoughts.

Greatings Group.... I am a brand new (well 24 hrs old really) user of APRS having received and constructed my TT3 without incident. You may have seen my K9RSQ-1 packets yesterday coming in via the TT3 and a VX-7R ... however, I was unable to get in with the 5W & ducky and had to bump the output power to at least 20W and use a magmount. Is this normal given my location (1120' asl behind Ft. Sanders West at I-140 & Kingston Pike)?
Also, I am insearch of advice regarding TNC/SoundCard decoder equipment to hook up inbetween the radios in the shack and the pc. I am currently using WebAPRS to view my packets. This equipment will be used with a FT-8900 for VHF and (for the time being) an FT-767GX for HF packet work (AF MARS) so I am looking for a reasonable solution that will accomodate both radios. I will also be using the equipment with a FT-7100 (similar to the FT-8900 for TNC interface) when deployed on Search and Rescue missions using the DMAPPER software to allow incorporation with MapTech USGS Topo maps. Any and all suggestions regarding RigBlaster/KAM/Trigertronics or other devices will be appreciated.

John, first of all, congratulations on being on APRS. I did get your two emails but haven't had a chance to go review the equipment at those URLs you provided. This group is a good place to ask your questions and I'm glad you found them for that. To be honest with you, I do not know what the Rigblaster can and can not do for you. I'm glad that you tried the TinyTrak3. I've got several of the TT1 and TT2 boards. I never really put them into service so therefore stopped buying them before the TT3 came out. Well here lately, I heard about the OpenTracker on the ballooning groups and decided to buy one of those instead. I like it so far. It reports temperature and battery voltage along with the usual APRS data. It even will stop transmissions if the battery voltage drops below a certain setpoint.

You have some equipment combinations that I'm just not aware of without some investigation to be able to answer any hookup questions. So I hope you will find some answers here. Good luck on APRS.

1435. two questions about a receive only hook up

Yahoo group: EastTNAPRS
Date: 2006-02-04 17:25:56 UTC
From: Jay
Topic: 1435 Message: 1435

hi everyone from ki4mzg
question one is: can i hook up an interface cable between
the headphone output of my scanner and the line in of my
computer direstly or do i need to go through a isolation
transformer?

question two is: can my ui view be set up to tx over the internet
while i rx through my scanner? would i be better just to keep
everything through the internet until i can get a radio to use just
for aprs?
thanks ki4mzg jay

SuitSat does not have APRS. Just voice and SSTV.

It's apparently in and out, depending on when the batteries thaw. My suspicion is that once the suit comes in to sunlight, then the batteries warm up. However, there's a 16 minute delay built in to the starter (NASA demanded it as a "Safety Precaution" for the Astronauts) and by the time it warms up and starts transmitting it's signal, it's past our area. We might have to wait until the passes where the Suit is going into darkness as opposed to coming out of the darkness.

Here are some passes upcoming for the ISS, the Suitsat will be ahead by a few seconds, getting farther ahead from the station by about 20-30 seconds per day:

AOS = Acquisition of Signal/Satellite
LOS - Loss of Signal/Satellite
```

Azm = Azimuth (in relation to True North, 90 degrees is due east, 180 due south, 270 due west, 0/360 due north)
Alt = Altitude (in degrees, 0 degrees is the horizon, 90 degrees is overhead)
V - Visible from the Ground (* means that the satellite can be seen)

Currently, the passes going from Southward to Northward (towards New England) are the ones where the SuitSat is coming from sunlight and entering darkness.

The program I use is made by David Ransom (dransom.com) and can be used to track any satellite. It's DOS based, so it can run on older machines. It's called STSOrbit Plus.

I have made a couple of APRS contacts through ISS but haven't tried in a few weeks.

Greg

You can hook it up direct. The isolation transformer will produce
better results, but it's not 100% necessary.

>
> question two is: can my ui view be set up to tx over the internet
> while i rx through my scanner? would i be better just to keep
> everything through the internet until i can get a radio to use just
> for aprs?

You could do this. To make this work, I would connect to an APRS
Server with port 14580 (a filtered port). Then I would use a filter to
give me zero information in from the internet: for example, o/NOTHING
See:
http://www.aprs-is.net/javAPRSSrvr/javaprsfilter.htm
for more information on filters.

Now, with this setup, your station will not bee seen on local RF
unless you send a message to someone on local RF. Once you do that,
your position along with the message packet will be gated to RF.

Welcome to the group and the world of ARPS!

I am surprised that you had to go up to 20W of power in that location. The external antenna would not surprise me at all. There are a few of us who run around town with 5W all/most of the time and get pretty good coverage. In that location, you should have had good coverage from WA4KJH-7, N4CWQ-1 and possibly WA4RYW-1 and N4TJM-1.

If you have seen some of the recent messages in this group about others using the TinyTrak3, you probably already know that the TT3 requires some adjustment to make it perform well. It's possible that you could adjust the audio level of the TT3 either up or down and get better response from the same location.

> Also, I am insearch of advice regarding TNC/SoundCard decoder
> equipment to hook up inbetween the radios in the shack and the
> pc.

I use the RASCAL interface (www.packetradio.com) and have had good success with it. With adjusting the audio level from the radio and the soundcard audio levels I have been able to get it to work as well as the TNC in my D700 for decoding APRS packets.

> I am currently using WebAPRS to view my packets.

This:
http://www.proaviator.com/findu/index.html
or something else?

> This equipment will be used with a FT-8900 for VHF and (for the

I've never tried to use the RASCAL with any HF rig, so I'm not sure if it will work...I'm sure you can find out for sure on their web site.

> I will also be using the equipment with a FT-7100 (similar to the

> missions using the DMAPPER software to allow incorporation with
> MapTech USGS Topo maps.

Search and Rescue...which organization are you working with? You may be interested in looking into the APRS software called Xastir:
http://www.xastir.org/
Many of the developers of Xastir are involved in Search and Rescue work and have put many SAR features into Xastir:
http://wetnet.net/~we7u/xastir/SAR.html

> Any and all suggestions regarding RigBlaster/KAM/Trigertronics or
> other devices will be appreciated.

Hopefully some others in the group will tell you about their experiences with these interfaces; I have not used any of them, so I don't have any advice at all about them.

This is great. I think when you put KF4CFO-7 on the air, it was the only station in the area, right?

I think you guys have really good coordination among those stations. I'm currious to hear how you apply APRS to events (weather or other).

CFO was the only station, and was put up because of a suggestion that Rocky Beckner, former Skywarn Amateur Radio Coordinator had made, because of the need of a way to get APRS signals from Knoxville to Chattanooga.

We have not used APRS for WX or events, other that the fact many of us use it for having a visual indication of what the NWS is putting out. I may try posting objects as severe WX happens, but we will have to see how that works out.

I look forward to getting No Pone up. We have had another delay, in that some of the other voice repeater equipment we have ordered has been delay. I think all of us will find No Pone to be very beneficial to E TN APRS.

Hi you'll,

I bought the TinyTrak 3 recently also and hooked it to a RS HTX-202 running 5 watts into a 1/4 wave at the moment. I will change it to a little more gain antenna soon after I am sure I have everything setup right. It is kinda kool for such a little thing. I did buy mine assembled as well because my fingers have gotten too big for the current part sizes.. :)) I also find that ferrite clamps are good additions for the various wires. I am a firm believer in the ferrite beams and clamps for nipping the stray rf that might be floating around.

I am currently setup for digi paths of wide1-1,wa4kjh-7 and relay,wa4kjh-7. Results have been varied as I cruise around the countryside. I also turned off the MIC E stuff on Saturday as another experiment but have yet to go out to see what difference it makes..

SuitSat Status 4 February

Paraphrasing Mark Twain....the demise of SuitSat-1 is highly exaggerated!!

It is now nearly 24 hours since the successful deployment of the SuitSat-1 experiment. These past 24 hours have been a wild ride of emotions...tremendous highs...deep lows when people reported no signals and said SuitSat-1 was dead and now....some optimism.

It is absolutely clear that SuitSat-1 is alive. It was successfully turned on by the ISS crew prior to deploy and the timing, micro-controller functions and audio appear to be operating nominally. The prime issue appears to be an extremely weak signal.

I have heard several recordings and have monitored two passes today. When the signal is above the noise level, you can clearly hear partials of the student voices, the station ID and the SSTV signal. One of the complicating factors in reception is the very deep fades that occur due to the spin of SuitSat.

Based on the information we know thus far, one can narrow down the issue to the antenna, the feedline, the transmitter output power and/or any of the connections in between. Through your help, we would like to narrow down the issue further and also gather some internal telemetry from the Suit.

If the transmitter is running at full power, we would expect the Suit to end operations in the next few days to a week. If it is not, then it will operate much longer. Since we do not know how long this experiment will last, we ask for those with powerful receive stations to listen for Suitsat---especially during direct overhead passes when the Suit is closest to your area. If you can record these passes and send the audio to us, it would be most appreciated. We will continue to be optimistic that this issue will right itself before the batteries are depleted. So please KEEP LISTENING!

Based on what we have learned, we would like to provide the following guidelines to save you time and facilitate gathering information:

1) You need as high a gain antenna as possible with mast mounted pre-amps. An arrow is the minimal set...it provides very brief snipets of the communications. HTs and scanners won't cut it.

2) I would not waste your time on passes below 40 degrees elevation. SuitSat is too far from your station to receive a reliable signal. We have found that closest approach provides several seconds of SuitSat communication with 22 element yagis.

3) The "gold" we are looking for right now is the telemetry information and how long the vehicle stays operational. So if you hear any of the telemetry, please let us know.

We are also working to get the voice repeater set up on ISS to downlink SuitSat audio on 437.80 in the event that the ISS Kenwood radio can receive the SuitSat transmissions. The repeater may be operational as early as mid-day Sunday. Please do NOT transmit on 145.99, voice or packet, until we have confirmed that SuitSat is no longer transmitting. These transmissions interfere with our ability to hear SuitSat.

While the transmission part of the SuitSat experiment has not been stellar, SuitSat-1 has been tremendously successful in several areas. Some of these successes include:

- We have captured the imagination of students and the general public worldwide through this unique experiment.

- The media attention to the SuitSat project represents one of the biggest ever for amateur radio.

- We have had well over 2 million internet hits on <http://www.suitsat.org>http://www.suitsat.org today.

- Our student's creative artwork, signatures and voices have been carried in space and are on-board the spacesuit---the students are now space travelers as the Suit rotates and orbits the Earth.

- Carried in the spacesuit CD are pictures of Roy Neal, K6DUE, and Thomas Kieselbach, DL2MDE, two of our colleagues who have contributed to the ARISS program and have since passed away.

- We successfully deployed an amateur radio satellite in a Spacesuit from the ISS, demonstrating to the space agencies that this can be safely done.

- This ARISS international team was able to fabricate, test and deliver a safe ham radio system to the ISS team 3 weeks after the international space agencies agreed to allow SuitSat to happen. This was a tremendous feat in of itself.

SuitSat-1/Radioskaf is a space pioneering effort. Pioneering efforts are challenging. Risk is high. But the future payoff is tremendous. As you have seen, we have not had total success. But we have captured the imagination of the students and the general public. And we have already learned a lot from this activity. This will help us and others grow from this experience.

Keep your spirits up and let's continue to be optimistic. And please keep monitoring!!

1) You need as high a gain antenna as possible with mast mounted pre-amps. An arrow is the minimal set...it provides very brief snipets of the communications. HTs and scanners won't cut it.

2) I would not waste your time on passes below 40 degrees elevation. SuitSat is too far from your station to receive a reliable signal. We have found that closest approach provides several seconds of SuitSat communication with 22 element yagis.

3) The "gold" we are looking for right now is the telemetry information and how long the vehicle stays operational. So if you hear any of the telemetry, please let us know.

We are also working to get the voice repeater set up on ISS to downlink SuitSat audio on 437.80 in the event that the ISS Kenwood radio can receive the SuitSat transmissions. The repeater may be operational as early as mid-day Sunday. Please do NOT transmit on 145.99, voice or packet, until we have confirmed that SuitSat is no longer transmitting. These transmissions interfere with our ability to hear SuitSat.

While the transmission part of the SuitSat experiment has not been stellar, SuitSat-1 has been tremendously successful in several areas. Some of these successes include:

- We have captured the imagination of students and the general public worldwide through this unique experiment.

- The media attention to the SuitSat project represents one of the biggest ever for amateur radio.

- We have had well over 2 million internet hits on <http://www.suitsat.org>http://www.suitsat.org today.

- Our student's creative artwork, signatures and voices have been carried in space and are on-board the spacesuit---the students are now space travelers as the Suit rotates and orbits the Earth.

- Carried in the spacesuit CD are pictures of Roy Neal, K6DUE, and Thomas Kieselbach, DL2MDE, two of our colleagues who have contributed to the ARISS program and have since passed away.

- We successfully deployed an amateur radio satellite in a Spacesuit from the ISS, demonstrating to the space agencies that this can be safely done.

- This ARISS international team was able to fabricate, test and deliver a safe ham radio system to the ISS team 3 weeks after the international space agencies agreed to allow SuitSat to happen. This was a tremendous feat in of itself.

SuitSat-1/Radioskaf is a space pioneering effort. Pioneering efforts are challenging. Risk is high. But the future payoff is tremendous. As you have seen, we have not had total success. But we have captured

the imagination of the students and the general public. And we have already learned a lot from this activity. This will help us and others grow from this experience.

Keep your spirits up and let's continue to be optimistic. And please keep monitoring!!

1454. MP3 Available - APRS Net Feb 5 2006

Yahoo group: EastTNAPRS
Date: 2006-02-06 17:49:07 UTC
From: submix
Topic: 1454 Message: 1454

Something new we are trying -

mp3 files are now available of the Sunday evening nets. I am storing these on a server that I manage, but space at some point could become an issue. Therefore, I would encourage you to save a copy of the file to your hard drive if you are interested in having these long term. I will keep a minimum of 4 weeks, but after a month or so, you might see them disappear.

The naming convention will be as follows:
yyyymmdd-aprsnet.mp3

Last night's mp3 can be found at:
http://www.reachingnewheights.org/aprsnet/20060205-aprsnet.mp3

Please email with any questions.

Moe,
Glad to hear the NWS is back in the APRS loop. That is the best way to relay information to them in my opinion. Could you forward the format critirea to me as well?
I really like hearing of Weather stations going live 24/7. I know NWS can get very useful information from that data.
What is the purpose of limiting the number of stations posting information to the NWS? What happens if those 4 stations are not available for some reason? Just wondering.

From: William McKeehan
Topic: 1448 Message: 1456

I've seen you driving around some, but have never really looked at your track.

How well are you getting into the digi's with the 5W HT?

What settings do you have on your TT3 Config? A screenshot of your config in the picture section of this site would be good to compare to mine. What about the pots inside of the TT3? Set to middle or some adjustment required.

1457. IGATE

Yahoo group: EastTNAPRS
Date: 2006-02-08 13:56:00 UTC
From: Doug Johnson
Topic: 1457 Message: 1457

Hi gang,

First I want to say thanks for the warm welcome both on packet and email. I has been a few years since I have been on APRS and it seems much has changed since that time.

I have a question about IGATE's. I know you probably don't want a digi up at every corner (you may want to coordinate their locations - understandable) but what about IGATEs. What are the thoughts about quantity and locations of IGATEs?

Look forward to your replies,
Doug Johnson

Topic: 1457 Message: 1458

Doug,

With what I understand about Igates (which might fill a thimble) most of them do RF to internet and "local" messages only. (The "local" message part is determined by a setting in the software.) To actually do Internet to RF requires that a station be "allowed" into the RF, for lack of a better term.

That said, I have been running my station (when I can keep it connected to the internet..dial up, yuk!) as a "local" Igate. I.E. I only have the transmit about 40km, which is just a little larger than McMinn Co, and at that, only our local McMinn stations that connect to APRS via the Internet only get gated. This puts their beacons and messages out where our locals can see them readily. I ran a log, and with just the beacons from 4 stations going thru, it adds 8 extra packets per hour. They get an UNPROTO path of "KF4CFO-7", so they get one hop out of KF4CFO-7.

We plan to move the operation from my station to our club station, KF4CFO-7, and once there, the stations UNPROTO for Inet to RF will be RF. Once we get No Pone up and running, the the UNPROTO will change to KF4YMC-3, giving one hop out of No Pone. We have high speed internet in the shack there, and it will be easier to keep it up and running.

It has enhanced our local APRS ability. My feeling is that if it is done, it needs to be a "local" only setup, selectively adding stations. The bigger Igates, such as WA4RYW, are better suited for gating Inet to RF stuff like the WX service objects, because they need to be seen over a wider area.

Hope that helps, looks like I rambled a little (:-)

1459. TT3 w/ VX-7R Report

Yahoo group: EastTNAPRS
Date: 2006-02-09 00:46:58 UTC
From: John Randle
Topic: 1459 Message: 1459

I had earlier mentioned that I was having difficulty getting in to a local node "barefoot" with the TT3 and needed to resort to a Mirage BD-35 to boost the power to about 30 W into a 1/4 wave magmount. Since I am located in West Knox County ... up behind Fort Sanders West (at 1120' asl) ... this seemed to be unacceptable performance.

With additional testing I have found that by increasing the R6 setting from mid-range to max, and the Tx Delay parameter from 300 to 1500 will allow the TT3 to get in "barefoot" with 2.5 W output (L3) into the same 1/4 wave mag mount. Increasing the calibration setting to 192 also seemed to slow down the packet transmission rate .. thereby improving reception reliablity. However, packets at the default 128 setting are still received, albeit not reliably.

I knew that the rubber duck that came with the VX-7R was inefficient .. I did not realize that it was such a dummy load. Needless to say I am acquiring a replacement.

Hope this info is helpful...

1461. Re: IGATE

Yahoo group: EastTNAPRS
Date: 2006-02-09 02:32:10 UTC
From: Scott
Topic: 1457 Message: 1461

Just to prove I don't know what I am talking about...

The 40km filter does absolutely nothing to keep the Igate "local". It just keeps what is seen on screen "local"! However, say you have a mobile that lives in your "local" area, but you want to be able to "see" him when he travels outside the area...if you have the 40km filter on, it WILL prevent him from being seen.

I think the most important aspect of doing an Inet to RF Igate is very careful selection of it's UNPROTO path. You don't want it going further than need be.

Anyway, the ignoramouse has spoken! All bow please as he exits...

1462. Re: IGATE

Yahoo group: EastTNAPRS
Date: 2006-02-09 14:47:00 UTC
From: Doug Johnson
Topic: 1457 Message: 1462

LOL

I think I have done more IGATE research with my software since your first message. I was beginning to think my software was lacking in features because I didn't see those options in Xastir.
My idea was to allow a little better view of my mobile while in the Morristown area. I have heard that the Lakeway ARC club is going to try to put the digi back up in the future but I am currently not seeing my portable (vx-5r with a tt3) show up on findu (path is RELAY,WIDE). I can see my portable (AF4MS-9) station with no problems at home (AF4MS-1) but I am not too sure many others have seen it. I tested for about 45 minutes last night around the 11pm time frame..

So, my theory was to think about an RF to Net IGATE until better coverage was in this area. That may not be the ideal option (begging for comments here) or the thoughts of a fill-in digi may be another discussion.

I am full of ideas but I just desire some direction on the best way to do things. Thanks to the group for all of the help so far.

1463. Re: IGATE

Yahoo group: EastTNAPRS
Date: 2006-02-09 15:12:20 UTC
From: William McKeehan
Topic: 1457 Message: 1463

I don't think there can be too many RF->Inet IGates.

All they do is take traffic from the 1200baud RF and put it on the high-bandwidth APRS-IS which has duplicate supression (only one copy of each packet will be kept on the APRS-IS regardless of how many hops it has on RF).

Gating to RF from the Internet needs to be done with care.

The Knoxville area is covered by WA4RYW-1; if anyone not on the local RF net sends a messages to someone in the local RF net, WA4RYW-1 will gate that packet from the internet to the local area (along with a position packet). My station is setup as a backup IGate; that is I only begin IGating to RF if WA4RYW-1 is not heard in over 30 minutes. Since setting my IGate up in this fashion, I have not gated anything to RF, but continue to gate from RF to Inet.

Gating other stations/packets should be really thought about before doing it as the amount of data on the APRS-IS can easily overwhelm the local RF network.

My thoughts...

1464. Re: IGATE

Yahoo group: EastTNAPRS
Date: 2006-02-09 17:05:03 UTC
From: Scott
Topic: 1457 Message: 1464

The tricky part I have found with the Igate doing Inet to RF is
getting it to figure out who is "local" to it. UI-VIEW's IGATE.INI
come defaulted that a local station has to be direct RF to the Igate,
no digi hops at all. Here in McMinn, I have mine set so that a "local"
is no more than 1 digi hop.

It takes a lot of twaeking to get it right, and still probably won't
be perfect. At least Roger wrote an IGATE.INI editor in the later
versions of UI-VIEW so you it makes it a little easier to do the tweaks.

1465. David Fridley, KG4FZR, passed away 02/09/06

Yahoo group: EastTNAPRS
Date: 2006-02-09 21:28:05 UTC
From: Scott
Topic: 1465 Message: 1465

David Fridley, KG4FZR, passed away 02/09/06 today. He was climbing one of his company's towers in North Carolina, and fell from about 20 feet.

David was owner of Business Cell Systems, AAA Tower, and past president of the McMinn Co Amateur Radio Club. He owned and co-owned several repeaters in the E TN area, and many hams enjoy the use of his repeaters and towers.

David was a Christian, and attended Fariview Baptist Church in Athens TN. He also managed Easterm Sky Ministries, his family's own organization that gave funds, vehicles, and supplies to missionaries.

His son John, KF4PVQ was at the site with him, and his wife Rita, KI4MJR was visiting friends nearby. Please keep them in prayer during this time. No other details are available, as this only happened this afternoon.

Scott NA4IT

1466. Re: TT3 w/ VX-7R Report

From: John Randle
Topic: 1459 Message: 1466

Yes David, I am using the CT-91 as well as the Byonics cable. I did some more testing tonight and was able to get in reliably with a TxD of 500, calibration of 128, at L2 power (1W) using a comet GP-9 (8.3db) from 1120'asl. The station hearing me was N4CQW-1, about 10 miles LOS distant. Again, I was amazed (and disappointed) at the attenuation of the rubber duck. Hopefully its replacement will do better as I can't carry the GP-9 around with me :}.

From: David Hoffman
Topic: 1459 Message: 1467

I run a FT-2500M mobile radio set on low power (5W) into a 1/4 wave mag mount antenna on the car.? I use a KPC3+ TNC though instead of a TinyTrak3.? I can still find a few dead zones on 5W, but I never run more then 5W on any of my APRS radios.? I would think, given your location and particulars, that you should be able to run the lowest power setting on that HT into the GP9 and do very well.? I'm glad to see you moved that calibration setting back down to 128.? Not totally sure what it effects, but it's another variable that makes things confusing with those TTs.?
I have a brand new CT-91 that I can not get to work.? Since your using one, I would like for you to test mine and see if it works for you.? I just need someone to make a swap long enough to confirm my thoughts.? It's not been modified in any way, but I still can't get it to work right.? I'm looking for someone to test it and just see if they come up with the same results.

1468. SSID's

Yahoo group: EastTNAPRS
Date: 2006-02-10 14:57:00 UTC
From: Doug Johnson
Topic: 1468 Message: 1468

Here is an easy question but probably a dumb one. I remember when I used APRS a few years back, the ssid of the callsign was linked to the icon used for display.

Looks like all of the software today does this differently. So, do most people leave off the ssid for their home station and use a -9 (or other number) for their mobile setups? Is there a standard guideline for the ssid's? Just curious...

From: Matt
Topic: 1469 Message: 1469

I have been unable to get gated to the internet the past 3 days while in North Knox County. I think i am getting digi'ed because I can always hear a repeat right after I transmit the packet.

Anyone else having problems or have any ideas what could be wrong?

I did change to a mobile radio using my TT3. It has been working fine up until 3 days ago. Like i said, it is still transmiting packet.

Thanks,

Matt

Here is the latest list I can find, dated June 04:

-1, 2, 3, 4 are for digipeaters and other home stations

-6 is for Operations via Satellite
-7 is for TH-D7 walkie talkies
-8 is for boats, sailboats and ships (maybe 802.11 in the future)
-9 is for Mobiles
-10 is for operation via The internet only
-11 is for APRStouch-tone users (and the occasional Balloons)
-14 is for Truckers
-15 is for HF

Topic: 1468 Message: 1471

In the early days, the SSID was the only way to identify the type of station you were using (and thus, the icon). There are now multiple ways to indicate which icon you want for your station. The SSID is used as a last resort.

Around here, I think most people think that a station without an SSID is a manned, fixed station; -1/-2 is a digipeater/igate and -9 is a mobile.

I use -9 for my TinyTrak3 mobile and -7 for my Kenwood Mobile to indicate that it is messaging capable.

From the TinyTrak3 manual:

TinyTrak3 was designed for hand held radios. Some mobile radios require more audio drive than TinyTrak3 puts out. If audio levels are too low, even with the R6 pot set to maximum, consider replacing the 220K R5 with a 100K resistor. This should allow for about double the audio range. R5 can even be replaced with a jumper (0 ohm resistor) for maximum audio.

Maybe switching to the mobile radio was not a good thing?

Like I said. I have had no trouble up until Wed. I switched to it Monday and it worked well, as you can see today. The raw packet you poted was from today, which was the first in 2 days. I had been checking the actal FindU site.

It did Snow Wednesday night...could there be a problem with your antenna connection?

I do see one packet from your station on findu from Thursday:

20060209205420,KG4YTT-3>APT311,WA4KJH-7*,WIDE,qAR,KI4HDU-2:>KG4YTT@bellsouth.net

2006/02/09 20:54:20 - that's about 4 in the afternoon local time.

Or what about WA4KJH-7 having an antenna problem with the snow?

Did anyone else see poor reception by WA4KJH-7 on Thursday and today?

From: af4ms
Topic: 1468 Message: 1480

So, my current home station is AF4MS-1 and my mobile is AF4MS-9. Possibly utilizing my home station as a limited IGATE (RF->Inet for now) do I need to keep it as a -1 or remove it because it is primarily a home station? What would be your advice?

Thanks,
Doug

The -1 is acceptable according to the SSID's.

IN THE WORDS OF WB4APR, Bob "These are only guidelines..."

SEEMS EVERYONE HAS AN OPINION. SO WHAT I WOULD SAY TO YOU IS:
" FOLLOW WHAT YOU BELEIVE IS THE RIGHT WAY TO OPERATE, AS LONG AS YOU DONT MAKE EVERYONE TOO MAD, LIKE I HAVE BEEN KNOW TO DO.". . . KEVIN / KF4YMC

-0 Home Station, Home Station running IGate.
-1 Digipeater, Home Station running a Relay Digi, Wx Digipeater
-2 Digipeater [#2 or] on 70CM
-3 Digipeater [#3]
-4 HF to VHF Gateway
-5 IGate (Not home station) -6 is for Operations via Satellite
-7 Kenwood D7 HH
-8 is for boats, sailboats and ships (maybe 802.11 in the future)
-9 is for Mobiles
-10 is for operation via The internet only
-11 is for APRStouch-tone users (and the occasional Balloons)
-12 Portable Units such as Laptops, Camp Sites etc.
-14 is for Truckers
-15 is for HF

1483. Re: IGATE

Yahoo group: EastTNAPRS
Date: 2006-02-11 02:44:00 UTC
From: af4ms
Topic: 1457 Message: 1483

Hi William,

This thread has been really helpful. The area I am having the most difficult time finding information is how is a "local" area determined in an IGATE? Is it done by the filters that are setup in the IGATE configs? And are those filters bi-directional? I guess what I am trying to ask is do the filters I place in my config serve two purposes. One being what I actually see on my station and (#2) are they used for determining what is actually passed to RF (if that option was enabled).

For instance, how did you determine what information you decided to allow to be passed from INET -> RF (if you were used as an IGATE because WA4RYW-1 was not available)?

Another question would be if a message destined to my station in Morristown from a distant station through the APRS-IS would it be IGATE'd from WA4RYW-1 or am I out of the "local" range? If not, are there other IGATE's in the area that would pass that information?

Again, I appreciate the info (and just let me know if I am overstepping my welcome ;)).

1484. Re: IGATE

Yahoo group: EastTNAPRS
Date: 2006-02-11 03:16:26 UTC
From: William McKeehan
Topic: 1457 Message: 1484

I'm glad you are finding this group helpful and I'm always happy to see more questions being asked, so feel free to keep them comming.

1. How to determine what is local for gating to RF from the internet.
This is software dependant, but most programs have a parameter that you set that defines local based on the number of digi-hops that a station takes to get to you via RF. The software that I use is javAPRSSrvr; it has two paramaters; Max hops and recent time. This lets me say if I have not seen the station in some number of minutes, then do not consider them local any longer. I do not know if Xastir has such options in it or if it considers everything it has heard via RF to be local.

2. What will be gated to RF
If a message is seen on the internet that originated from a non-local station and is being sent to a local station, then that message will get gated out to RF. With the first message (and intervals afterward as messages continue), a position packet for the originating station will be sent out to RF as well.

3. What does WA4RYW-1 consider local
I believe that WA4RYW-1 considers anything it heard within 3 hops to be local. Your station should only be one hop away from WA4RYW-1 (that one hop being WA4KJH-7) or at most two hops (a fill-in digi before WA4KJH-7), so any message sent to you from anyone on the internet should be gated by WA4RYW-1 to RF.

4. Are more IGates needed
If there are 2 (or more) IGates that serve the same area (like my IGate and WA4RYW-1 which both hear WA4KJH-7 as the primary wide area digi), then each IGate would try to gate the same packets destined for a local RF station. The result would be two packets going to the big digi at the same time, often resulting in a collision and no digipete from the big digi - thus no message to the targeted station.

5. Other things to consider
Most IGates will also let you specify stations to gate to RF. All of the MRX* objects (the weather information) that you see are gated by WA4RYW-1 because he has configured his station to gate those specifically. This is the area where the most care must be taken as the software will let you attempt to gate far too much to RF if you're not careful. One other example that I can think of is when Moe, N4CQW was first getting involved in APRS, I configured my IGate to gate all of his packets to RF (not just messages). This let him have a presence on RF with only an internet connection. Moe has since added a TNC or two to his collection and all of his stuff on RF is

put there by him now.

I hope this helps...let me know if anything is fuzzy.

Thanks William!

On point # 4 below

> big digi at the same time, often resulting in a collision and no
> digipete from the big digi - thus no message to the targeted
station.

Could this also result in dupes (duplicate messages on RF)? I could
see something like this causing a saturation of the RF Network. It
almost sounds like the old "network hub" saturation in computer
networks pushing them to install higher speeds and switching
topologies.

Good, I will not look further into IGATE'ing Inet->RF. You mentioned
in an earlier post that it wouldn't be a problem to go RF->Inet so I
may only utilize that method.

The server I am attaching to is tennessee.aprs2.net port 14580 which
I felt that using a secondary server would be better. Also, my
filter is r/36/-83/250 setup for the Inet connection. Do you see any
concerns with those settings?

Thanks,
Doug - AF4MS

1486. Multiple packets of WX info

Yahoo group: EastTNAPRS
Date: 2006-02-11 04:41:07 UTC
From: Scott
Topic: 1486 Message: 1486

Well, I'll probably get accused of being the "packet police" again, but I believe we may be seeing a trend here that could result in some problems. This is a listing of packets RX'd in McMinn Co in a 2 minute period of time. Not much else got through (or could). We need the WX data out there on RF, just not so many repeat packets.

Another thought on keeping the RF out to "local", and I think I already mentioned this, is that an Igate that is gating internt to RF needs to be set so that the outgoing RF UNPROTO is only one hop or so. Mine is set as "KF4CFO-7" and that's all. I DO NOT use my default beacon UNPROTO, which is KF4CFO-7, WIDE2-2. That would result in everything I gate to RF going all the way to Knoxville and down into GA. With only KF4CFO-7 in the gate's UNPROTO, only the stations hearing KF4CFO-7 see the baecons or messages, and no other digipeats are done.

Thanks Scott!

I think it is all starting to make sense now. Sometimes there are situations that I have to bang my head against the wall a few times to allow the information to sink in.

Thanks for the help.

Doug,

It took a lot of reading and trial and error, and monitoring by myself and two other stations to get it where we thought it needed to be for McMinn Co, and looking at it tonight, seems to be doing well. All our "internet only connected" stations and the WX data from MRX, HTX, HUN, and OHX gets one hop out of me to KF4CFO-7 and it stops after that. That amounts to 15 extra packets in 15 minutes that wouldn't be there otherwise (or 60 packets per hour), and all our local internet guys can message back and forth with the RF stations, AND the RF guys see all the WX info, just as if they were internet connected also. And, it isn't working KF4CFO-7 to death. (All that, and I am using an old Ten Tec 5W HT for TX/RX!)

Response below.

On Fri, February 10, 2006 10:40 pm, af4ms said:
> Could this also result in dupes (duplicate messages on RF)? I could
see something like this causing a saturation of the RF Network. It
almost sounds like the old "network hub" saturation in computer
> networks pushing them to install higher speeds and switching
> topologies.

You are exactly correct. The RF network is more like the old 10Base-2
network and is only at 1200 baud, so it's pretty easy to saturate.
Infact, some believe that only 60 stations in a given area will
saturate the channel.

>
> Good, I will not look further into IGATE'ing Inet->RF. You
mentioned in an earlier post that it wouldn't be a problem to go RF-
>Inet so I may only utilize that method.

Everyone that has an always-on Internet connection could be an RF-
>Inet IGate without causing any problems.

>
> The server I am attaching to is tennessee.aprs2.net port 14580
which I felt that using a secondary server would be better. Also, my
> filter is r/36/-83/250 setup for the Inet connection. Do you see
any concerns with those settings?

No concerns that I see - it's similar to my settings. By the way,
tennessee.aprs2.net is ran/owned by WA4RYW. My settings are similar;
I connect to rotate.aprs2.net:14580 with a filter of r/36/-84/200.

1491. Re: Multiple packets of WX info

Yahoo group: EastTNAPRS
Date: 2006-02-11 13:50:52 UTC
From: William McKeehan
Topic: 1486 Message: 1491

I have started turnng the volume up on my packet station at the house - not too loud, but loud enough to hear what's goin on. I noticed that these packets were coming in groups togather just by listening. I think the pattern is a set of packets go out, then a short pause (30-60 seconds) and then they are duplicated. Then a longer pause (maybe 5-10 minutes or so).

This seems to be in-line with what you would really want. Why?
1. The duplicate packets sent in case there's a collision with the original packets. I do something similar with the EastTNAPRS bulletins that I publish.
2. Why so often on repeating the information? Go mobile and it will become clear. Think about the times when a storm is quick to move in and vanish; you get in the vehicle and start to drive, you want to be alerted right away.

To me, I would like to only see MRX on RF in this area; I think that the OHX is nice to look at, but when I'm on RF (especially when mobile) it's just clutter to know that there's a storm in Nashville. I realize that I'm not the only one that uses this data on RF, so if others see the value in having it there, then I'm willing to deal with it.

Having said all of that, I agree that listening/watching all of these messages it does seem excessive. But I do not know of any way to minimize the frequency with which these packets are gated except to turn them off.

1492. Re: Multiple packets of WX info

Yahoo group: EastTNAPRS
Date: 2006-02-11 14:01:47 UTC
From: William McKeehan
Topic: 1486 Message: 1492

I just noticed...you're seeing more duplicates than I'm seeing - probably because of the path that WA4RYW-1 is using to gate the packets.

Here's a snip from my log file from this morning:
[<R:06:30:08.557 Sat 11-FEB-2006]WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-2:}
MRXWSW>APRS,TCPIP,WA4RYW-1*::SKYMRX :HEAVY SNOW WARNING IS

Still a lot of packets, but I don't think it's as many as you are seeing. With my packets, you can see that they came witha path of WA4KJH-7*,WIDE2-2, so you probably heard them via multiple hops. I'm not sure why you log does not show the 3rd party packet bundle to indicate the true path that the packets came to you.

William
KI4HDU

1493. FW: [aprssig] Kenwood D7 data cables

Yahoo group: EastTNAPRS
Date: 2006-02-11 14:08:37 UTC
From: William McKeehan
Topic: 1493 Message: 1493

I picked up a couple of these and thought that some of you may be interested in them also.

Note that they should also work with the TM-D700 as the TH-D7 and TM-D700 use the same GPS plug.

Subject: [aprssig] Kenwood D7 data cables
From: scott@...
Date: Wed, February 8, 2006 8:30 pm
To: "'TAPR APRS Mailing List'" <aprssig@...>

I quickly used up the one GPS/data cable that came with my D7 and was a little shocked to see HRO charging $19.95 for 'em separately. Ok, it's a Kenwood part, so I'm not *that* surprised, but anyway...

I've added a suitable substitute to my inventory, at http://www.argentdata.com/catalog/product_info.php?products_id=29, for $2.50 each. They're basically the same thing, but longer (6 feet), with a heavier-duty cable (3.7mm vs. 2mm), so they're not as flexible but I'm also not nearly as afraid of them falling apart after a little flexing. They're actually lower profile and stick out about 2mm less when inserted, but still have plenty of clearance.

Not sure if anyone else is carrying these cheap, but I wanted to have a bunch on hand anyway, so what the heck. I've still got plenty of pFranc-style Garmin connectors, so you can get parts for a GPS-to-D7 cable for under $8.50, shipping included.

Sorry for the lack of pictures - I'll drag out the photography setup once the speaker/mic cables get here.

1494. TM-D700 MSG Groups Configuration

Yahoo group: EastTNAPRS
Date: 2006-02-11 14:19:47 UTC
From: William McKeehan
Topic: 1494 Message: 1494

I like weather events that happen over an extended amount of time. That lets me get a better picture of what data is available and what I can do with it.

Seeing packets like this:
WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-2:}MRXWSW>APRS,TCPIP,WA4RYW-1*::SKYMRX :HEAVY SNOW WARNING REMAINS IN EFFECT FROM {B1rEC
WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-2:}MRXWSW>APRS,TCPIP,WA4RYW-1*::SKYMRX :MIDNIGHT TONIGHT TO 7 PM EST SUNDAY {B1rBD

I wondered how to see this valuable information while mobile with the D700. I did some research and found it.

MSG Groups! I added SKYMRX to my MSG Groups list in the D700, now these messages to SKYMRX show up on the D700 like a message to me.

It's menu 3-P in the D700.

See page 34 of the TM-D700A Specialized manual for more details on this configuration option.

Topic: 1486 Message: 1497

What I was getting at is this:

For APRS to TX anything, there is a "listen and wait" factor there. If a station was hearing what I had posted, are beacons, messages, or objects from other stations going to be TX'd, let alone RX'd? I see them being "eaten" by packet collisions.

I agree we need the WX stuff, I was the one that suggested it. But, probably just not so many hops. I realize the those of you in Knoxville don't see what we do, and may look totally different up there. I certainly didn't realize the with the path covering most all of E TN that it would produce that much traffic.

As I said in an earlier post dealing with Igates, last night, I was seeing my station gate out 1 packet per minute extra above normal traffic, which is negligible. That was for 4 APRS stations internet connected, MRX, HTX, HUN, and OHX. I do one hop to KF4CFO-7 and it stops there. And, for our local stations, it worked well.

It might be better to "localize" the WX being gated, and have it stay local for Knoxville, local for midway between Knox and Chattanooga, and local for Chattanooga. That would keep the needed traffic to a minimum.

Just going to take some looking at. Here again, if you all don't think it is a problem, then nothing needs to be done. We will deal with it here.

1498. KF4BRS Digi in Erwin, TN

Yahoo group: EastTNAPRS
Date: 2006-02-11 22:46:29 UTC
From: William McKeehan
Topic: 1498 Message: 1498

FYI:

---------- Original Message ----------
Subject: [Tennessee_Digital_Group] Spam:*****, kf4brs APRS digi
From: "Bob Thomas" <ks4ng@...>
Date: Sat, February 11, 2006 7:24 pm

Fellow Packeteers and Digi Captains,
As some of you have noticed already, please note the following upgrade to the former KF4BRS APRS digipeater near Erwin, TN:
1. HID is now off (thanks to KB4YTM for the suggestions and link below)

2. The callsign has been changed to KS4NG-7 (I may change this SSID# soon)

3. The beacon has changed, but I did this from memory. Let me know if I need to change it as I haven't "seen" it yet.
4. The Unproto path has been changed from Trace4-4 to Wide3-3

5. Problems or suggestions? suggestions are always welcome....that's why i'm a part of this group.

The tnc was setup on July 10th., 1997 and the parameters were untouched until Feb. 10th., 2006. The frequency was changed for a while in 2005 for testing. The rig is an Alinco DR-140 packet rig, antenna is a ringo 5/8~, and the tnc is an early kpc3+ modified to ver. 8.2 firmware.

Here's the link rich, kb4ytm, sent me for the latest setup for an APRS digi: http://www.ew.usna.edu/~bruninga/aprs/fix14439.html

73,
bob thomas
ks4ng

1502. Hello

Yahoo group: EastTNAPRS
Date: 2006-02-12 01:40:05 UTC
From: Mark
Topic: 93 Message: 1502

Hello All!

My name is Mark. I live in a hole in West Knoxville. I am new to the list (about 24Hrs.) I learned about it via a beacon on on 144.39. When I joined, I saw where there is a local voice net. I downloaded and listened to the last one.

Is there a voice (2Meter etc.) frequency where APRSer gather/discuss the topic other than the weekly net?

Thank you,
Mark

1503. Hello

Welcome to the group!

I tend to listen to 146.940 most of the time...but I don't get on there and talk very often, but if you shout at me I'll often be there listening.

1513. RE: [EastTNAPRS] Weekly net audio?

Yahoo group: EastTNAPRS
Date: 2006-02-13 03:40:28 UTC
From: Travis J. Maclay
Topic: 1511 Message: 1513

I posted last week's net, but due to a scheduling conflict tonight, I could not record. Will be back on schedule for next Sunday PM.

Last week's net audio is in MP3 format and is in the File section.

Here's the msg I posted last week:

Something new we are trying -

mp3 files are now available of the Sunday evening nets. I am storing these on a server that I manage, but space at some point could become an issue. Therefore, I would encourage you to save a copy of the file to your hard drive if you are interested in having these long term. I will keep a minimum of 4 weeks, but after a month or so, you might see them disappear.

The naming convention will be as follows:
yyyymmdd-aprsnet.mp3

Last night's mp3 can be found at:
http://www.reachingnewheights.org/aprsnet/20060205-aprsnet.mp3

Please email with any questions.

Travis

I had to increase power from 5w to 20w last night to reach WA4KJH-7 for net check-in.

I thought I had a problem and wasted time switching radios.

Travis,

Thanks for the weekly upload of the net audio. I
seldom can make the net and enjoy listening to what
went on.

1520. UTARC Balloon Launch tentatively planned for this weekend

Yahoo group: EastTNAPRS
Date: 2006-02-16 05:36:13 UTC
From: Greg Williams
Topic: 1511 Message: 1520

The following information is still tentative. The sudden timing of this has thrown a few curveballs in the loop. WE ARE NEEDING MOBILE APRS USERS TO ASSIST IN TRACKING THE PAYLOAD. PLEASE SEND AN EMAIL TO MIKE, KJ4Z, AT MIKE@... TO LET HIM KNOW YOU CAN CHASE.

Launch is *tentatively* scheduled for *7:00 AM this Saturday*. This is to allow for measuring ascent rates as the balloon becomes exposed to sunlight as it rises over the horizon.

Payload is a 2m APRS transmitter beaconing on 144.390 - the Nat'l APRS frequency. There will also be a 30m CW beacon on 10.113.5 Mhz (Mike, check that frequency) and it will consist of two boxes strapped together as one payload not exceeding approximately 4 pounds on takeoff. One box will contain liquid for use as ballast with a pump programmed to pump out the liquid contents in order to increase the lift through the high-speed winds of the stratosphere. The other box will contain the electronics for the operations of the ballast pump as well as the transmitters for tracking and recovery.

Launch is *tentatively *scheduled for the UC area outside of Neyland Stadium (launch site of UX-3).
*
*And last but not least, in order to keep with UX launch tradition, the weather forecast is downright *crummy *for the weekend. The Sunday forecast looks to be the most promising with the possibility of decent weather (although chilly) for the launch. *

Saturday*
Rain And Snow Hi: 41? - Chance of precipitation 50%. Mostly cloudy.
A chance of rain and snow in the morning...*Then a chance of rain in the afternoon*. Highs in the lower 40s.

Saturday Night
Rain Showers Lo: 25? - Chance of precipitation 20%. Mostly cloudy.
A slight chance of rain showers and snow showers in the evening...Then a *slight chance of snow showers after midnight*. Lows in the mid 20s.

Sunday
Partly Cloudy Hi: 41?

Sunday Night
Rain Showers Lo: 29? - Chance of precipitation 40%. Mostly cloudy.
A chance of rain showers in the evening...*Then a chance of snow showers after midnight*. Lows in the upper 20s.

Presidents Day
Rain Showers Hi: 45? - Chance of precipitation 40%. Mostly cloudy.

A chance of snow showers and rain showers in the morning...*Then a chance of rain showers in the afternoon*.

Monday Night
Rain Showers Lo: 33? - Chance of precipitation 40%, *Mostly cloudy with a 40 percent chance of rain showers*. Lows in the lower to mid 30s.

If I had a vote, I'd pick Sunday. I'm off Monday anyways, and it is a holiday. But I'll leave that to the ones who know the payload better than I do.

Greg, K4HSM

1523. IGATE Question

Yahoo group: EastTNAPRS
Date: 2006-02-16 12:37:22 UTC
From: Matt
Topic: 1523 Message: 1523

Hey guys! I have yet another question for you.

Is it possible to run a recieve only IGATE station? I have UI-View installed on the home PC for soundcard use and a scanner. If this is possibe, it could be used as a fill-in for FindU.com for the northern areas.

Let me know!

From: William McKeehan
Topic: 1523 Message: 1525

Absolutely.

While our area has a good number of RF->Internet IGates already, having more listening and gating will not hurt anything and may even help.

To get an idea of how much work your IGate is doing, have a look at this web site:

http://www.db0anf.de/hamweb/aprsdb/showdata/KI4HDU-2/shdigiusers

(Note the above URL is for my IGate.)

I think everyone with a high-speed internet connection could run an RF->Inet IGate without causing any problems. The only problems come in running a 2-way IGate (i.e., Inet->RF).

1526. GPS receiver suggestions

Yahoo group: EastTNAPRS
Date: 2006-02-16 19:07:39 UTC
From: Stephen
Topic: 1526 Message: 1526

Hey guys,
I have a Kenwood TH-D7AG on the way to me and I was wondering if
someone could suggest a good inexpensive GPS receiver for me to use
with this.

I don't care too much about features, as the only thing I am really
interested in is the NMEA signal to put into my radio, and the ability
to power it off of 13.8vdc, as well as an external antenna port.

This will be a permanent installation in my car. At some point, I am
going to get a dedicated mobile rig and tnc, but the HT will do for
now :)

Thanks and 73

1530. UI-VIEW / UI-NWS users re: Latest Shapefiles

Yahoo group: EastTNAPRS
Date: 2006-02-18 14:52:42 UTC
From: Scott
Topic: 1530 Message: 1530

The latest shape files are as follows:

Counties (dated 2 April 2006)
http://www.weather.gov/geodata/catalog/county/data/c_10fe06.zip

Zones (dated 9 May 2006)
http://www.weather.gov/geodata/catalog/wsom/data/z_14fe06.zip

Marine Zones (dated 2 May 2006)
http://weather.gov/geodata/catalog/wsom/data/mz10ja06.zip

These are fairly large downloads for dial-up, probably taking the bigger part of an hour or more.

In a previous post, I had inadvertently posted a wrong named file. Any time you do download them, follow these guidelines per the UI-NWS help file:

"To be able to use UI-NWS, you need the NWS shapefiles for counties, zones and marine zones. UI-NWS is useless without these files. They are the shapefile sets prefixed "c_", "z_" and "mz". Each set contains three files - .DBF, .SHP and .SHX.

If you have already downloaded these shapefiles for use with other software, then you can use your existing files. Otherwise, you need to download them from the NWS site. The starting page is http://www.nws.noaa.gov/geodata/"

WARNING: The NWS does change the URL's and descriptions frequently. You may have to do some searching. Just make sure "the shapefile sets prefixed "c_", "z_" and "mz"."

I will try to look them up and post them here once a month.

I tried to post 3-4 times to this list yesterday and the day before and nothing went through. I was posting from this address (via webmail) and got no bounces or errors.

I was posting that the balloon launch was cancelled due to the excessive high winds forecasted for today and tomorrow (150+ in the higher altitudes) that were not going to be much use for our experiments on vertical lift.

Did anyone else try to post to the list the last 48 hours?

Greg

Subject: [EastTNAPRS] Posts to the mailing list

I tried to post 3-4 times to this list yesterday and the day before and nothing went through. I was posting from this address (via webmail) and got no bounces or errors.

I was posting that the balloon launch was cancelled due to the excessive high winds forecasted for today and tomorrow (150+ in the higher altitudes) that were not going to be much use for our experiments on vertical lift.

Did anyone else try to post to the list the last 48 hours?

Greg

1536. Cool I made it!!!!

Yahoo group: EastTNAPRS
Date: 2006-02-19 15:00:10 UTC
From: Stephen
Topic: 1536 Message: 1536

http://www.findu.com/cgi-bin/find.cgi?call=n1vlv

I just got my shiny new TH-D7AG Friday and I was playing around with it and UI-View 32 lastnight and I made it to findu.com! There must be a digipeater close by, I am only using the rubber duck antenna on my HT.

I also hear a lot of activity on 144.390, even from distant stations, some as far away as Ohio and Kentucky, is this merely the digipeater retransmitting their packets from other digipeaters or was I experiencing a band opening?

APRS rocks! I can't wait to get more into it and get a mobile setup going in my car.

I hate to burst your bubble, but it looks like you made it to findu
because your station was connected to the internet.

You may be hearing stations direct. The one way to tell in UI-View is
to look at the "Direct Stations" list via the "Lists" menu. I would be
currious to know who you hear direct.

1539. My WX Station

Yahoo group: EastTNAPRS
Date: 2006-02-20 15:31:50 UTC
From: William McKeehan
Topic: 1539 Message: 1539

On the net last night, we discussed a weather station that I picked up at Sam's Club this weekend.

The unit I purchased is a La Crosse WS-2317-CP:
http://www.samsclub.com/shopping/navigate.do?dest=5&item=126300&pCatg=1460

The rain gauge/pc-interface was not available in the store and had to be ordered on-line @ samsclub.com:
http://www.samsclub.com/shopping/navigate.do?dest=5&item=157630&pCatg=1460

The unit I picked up at Sam's was $99; the rain gauge was $20 (plus shipping). I found it to be inexpensive enough to give it a try.

Once I get the pc-interface, I'll be playing with some software to get my WX data published. The software that I am looking at is Open2300:
http://www.lavrsen.dk/twiki/bin/view/Open2300/WebHome

I'll be using this on Linux, but it has binaries for Windows and should be usable there also.

Just a note, to use Lacross stations on UI-VIEW, you have to rin
UI-Weather. It acts as a "data stream converter" for UI-VIEW.

WA4RYW-1 is setup to IGate to RF. Just try to send a message to anyone on local RF and your message should get gated out.

You can try to send me a message if you want a test subject.

The path that you use should have no affect on what is used; that is determined by the IGate station, so any (or no) path should be fine.

In looking around, it looks like your message never made it to the internet (not FindU.com anyway).

1547. Important lesson on Internet to RF Igates in UI-VIEW32

Yahoo group: EastTNAPRS
Date: 2006-02-23 04:20:51 UTC
From: Scott
Topic: 1547 Message: 1547

Well, I found out something interesting...

Even though you "allow" stations in UI-VIEW's Igate.ini file, if you hook up to a filtered server, you have to also allow them there. If they don't get into your machine to start with, it won't let them out.

There are a couple of ways to do that. One is allow each call sign, and the other is to do a "My Range Filter" which is letting stations into your machine from a preset distance around you.

I had CFO's gate doing OK for most of our stations, with the exception of 2 that were a little "out of range". I did some changes and totally screwed it up, and had to figure out what had happened, and the "my range filter" was set too narrow.

Anyway, just FYI IYNTK (If You Need To Know)

I posted three objects to the grid.

UX-7 Launch Site south of Cookeville
UX-7's closest predicted landing site near Sunbright (36.12.93N, 084.46.19W)
UX-7's farthest predicted landing site west of Lafollette (36.20.75N, 083.54.57W)

1549. Am I making it to an IGate

Yahoo group: EastTNAPRS
Date: 2006-02-28 15:58:35 UTC
From: William McKeehan
Topic: 1549 Message: 1549

I took the question that I got from Travis on the Sunday night net and posted it to the APRS Sig on TAPR. So far, I have one very good response which I have included below.

The next time you are away from home and want to see if your packets are making it to an IGate, try sending a message to POSITS. As Pete says, this is not a sure way to know, but if you do get a response, then it's certain that your message made it to the internet. If you do not get a reply, you may still be making it to the internet.

I look forward to hearing your results.

Subject: RE: [aprssig] Digipeater routing: 'Get me to findu'
From: "AE5PL Lists" <HamLists@...>
Date: Tue, February 28, 2006 10:45 am
To: "TAPR APRS Mailing List" <aprssig@...pr.org>

Not a sure way (requires a two-way IGate), but you can try sending a blank (no text) message to POSITS. You should here a Morse code R showing that you received an ACK from the server and receive a message from POSITS indicating that your message was invalid.

As a reminder, the POSITS server can generate a message "from" a queried station. If you send a message to POSITS with a callsign (case is significant), you will get an unnumbered message back indicating how long ago the station was heard appearing to be from the station enquired about. This will cause the local IGate to also pass that station's posit when it becomes available. The message is unnumbered to prevent an ack issue with non-message capable devices.

POSITS (not the queried station) acks your message and also generates a "not found" message if the station is not found in the jFindu database. POSITS does not generate position packets (keeps the integrity of the near-realtime aspect of APRS).

Do not query about the station you are operating from (I don't think) because I can't guarantee how different devices will like seeing
messages from themselves.

More info than you probably wanted to know but I figured I would take the opportunity to remind folks that the server was there. ;-)

Yahoo group: EastTNAPRS
Date: 2006-03-01 21:43:12 UTC
From: William McKeehan
Topic: 1551 Message: 1551

Mark Sproul has posted a new version of WinAPRS on www.winaprs.org

WinAPRS Version 2.8.4 - Feb 28, 2006
* Fixed bug in Canadian Toporama display
* Many Improvements to Tiger drawing including drawing polygons from biggest to smallest
* Improved Tiger road labeling
* Added vector icons for road signs
* Fixed bug in color display of DEM (Digital Elevation Model) for Windows, added more color modes
* Added option to display Barometric presure in inches of HG
* Fixed bug in Base91 decoding thanks to Herb KB7UVC for the help
* Improvements to rotated text labels for roads
* Fixed annoying white space at right side of window when maximized

I would like to see it sometime if someone has it up and running.

From: Jeff Yawn
Topic: 1552 Message: 1552

As we begin to move forward with the creation of a new "Digital District" in Tennessee. I would like to ask for your help. First on the agenda is to form a planning committee and create a Section Digital Emergency Plan. I have done some research on digital plans already and have some ideas on how to move forward BUT, I am a firm believer that no one person should make all the decisions. So my first goal is to gather a committee. We can do a lot of discussion by email and I am planning to make a trip to each of the 3 areas of the State over the next couple of months so I can sit down face to face with the digital operators in that area. My first thought is to have at least one representative from each of the current districts on the committee. Qualifications needed; be able to work with others, have a sincere desire to help, and some digital experience. Digital experience can include any digital mode of communication, packet, winlink, psk, cw, amtor, pactor, aprs, the list goes on and on. Membership in any group or organization is not needed but since this is an Emergency Service function I would encourage each member to join their local ARES and or RACES groups as time permits. If you or someone you know would be a fit for this planning committee please have them to contact me directly at the email address below.

Scott wrote: "Hey Bill,

Glad to hear the Roane EOC is getting upgrades. Question...did you get
a grant or something to do the upgrades?

Scott NA4IT
McMinn EC"

Scott -
Our EMA Director found some good grant money. We already had a dualband VHF/UHF Yaesu in the EOC. The OLD OLD Ten-Tec HF radio has been dead for a number of years. We hunted about, and he told me to submit a list of what was needed. So the TS2000 and a matching HT are coming, as well as a triband vertical for the 6m/2m/70cm part of the TS2000 (already have dualband antenna on the Yaesu). We want to be able to do digital up to and including Winlink 2000 on HF. Hence the Rigblaster Pro (will essentially be for the Yaesu VHF/UHF) and the SCS PTC-II Pro TNC for the TS2000.

I worked with the administrator of the hospital in Harriman, which had never had a radio in it before (we had to bring our own radios to hook to their coax drop), and we got a TS2000 etc on a grant already installed there. Still have to get it programmed.

So things are looking up, and it only makes sense to include digital planning for emcomm, since ICS/NIMS standards call for the ability to maintain data/email capabilities, etc.

Bill KI4FZT
Roane EC

1557. Knoxville Marathon

Yahoo group: EastTNAPRS
Date: 2006-03-02 16:15:58 UTC
From: William McKeehan
Topic: 1557 Message: 1557

Hey Guys! The Knoxville Marathon is scheduled for March 26. There is a need for a large number of communicators to help support this event.

This event will be an APRS enhanced event. We currently have plans/operators/stations to provide a LEAD (showing the location of the front runner) and a TAIL (showing the location of the last runner). We also have a station equiped to display at the finish line (and if all goes well this will be displayed on the Jumbotron for everyone to see). We have a need for atleast 1 mobile digi to help fill in for the low powered tracker that we have on the TAIL and we have a need for two more trackers to be on K-tran buses or trollies for the event.

This is an opportunity to use APRS in a situation where it is perfectly designed to function. We need some volunteers to help make this a reality.

Anyone with equipment willing to help out, please contact either me or David, KE4FGW, by this weekend.

Thanks!
William

We had a good bit of discussion about this on the net this past Sunday.

If my notes are correct, the RX frequency is 145.8. The uplink for APRS is 145.99. The uplink for voice is 144.99.

www.issfanclub.com is one place that you can go to identify when it will make a pass.

There was another website mentioned, but I'm not sure what it was. There were a few guys on the net (and on this group) that have actually sent packets via ISS. Maybe they'll jump in and tell you a bit more.

From: Stephen
Topic: 1561 Message: 1561

Just wanted to say that I had the pleasure of attending this and Greg Williams, K4HSM, did a great job presenting it and got to meet him as well. Myself and my friend Dan, KF4LNE, thoroughly enjoyed the presentation and we still sit in awe that these balloon experiments are capable of doing what they are doing.

Was really cool to see something like this around here, perhaps this could be an activity some of us locals could get into :)

Thanks for the presentation Greg!

We have an APRS discussion net Sunday night at 8:00 PM on the 146.94
repeater; everyone is welcome to participate in the net's discussions.
You should join us if you have a chance.

As for helping...add what you can about communicating via ISS et.al.
I'm sure that KG4YTT would appreciate any further help you may provide.

From: ggsmithtn
Topic: 1558 Message: 1564

Hello Matt,

The Frequencies mentioned are correct, a non-standard split of uplink 145.99 MHz, downlink of 145.800 MHz(worldwide, standard ISS downlink)

You need to add ARISS to the begining of your path, most people do ARISS,WIDE

If picked up by a SatGate (most packets are) it is placed on the APRS network

You can see your digipeats on a map, as well as others worldwide for the last 12-24 hours at
http://www.ariss.net/index.cgi

You should only transmit while the ISS is in range.
You can get a list of pass times for your area at:
http://www.amsat.org/amsat-new/tools/predict/index.php

73,
Gould

To all my fellow APRS Hammers!!

I have the following items I'd like to sell:

Garmin GPS Street Pilot III
Color display, cigarette lighter adapter with speaker, (yes it talks to you) dash mount and yoke mount, windscreen mount antenna, flip up bayonette antenna, RS232 db9 serial cable, Metroguide software on CD and programmable chip with programmer.
Great unit for APRS, tested on TMD-700, displays packets recieved with labels on COLOR SCREEN when in mode 6 on 700, Have original box, manuals, etc. $600, will add serial to USB cable for $625.
used as mobile with IC2720 and a Laptop using UI-View32, APRS+SA, and any other Software.

WX Station, LaCrosse 2310, has Main display, rain guage, annometer, outside sensor, Heavy Weather CD, will add program that converts WX data to APRS data
that I used to send thru UI-View32.
$150

Will Demo both before completeing sale.

Serious inquires only, NO TRADE OFFERS PLEASE!

1567. Re: ISS

Yahoo group: EastTNAPRS
Date: 2006-03-09 15:04:09 UTC
From: kphillip162
Topic: 1558 Message: 1567

I try to work the ISS almost everynight. I use a 6 element beam and only point it to the Azimuth (compass point) since I don't have elevation control) I use Orbitron tracking software which is a free download. I have an old 433 MHz pc and an old Alinco DJ-500T HT going into a homebrew 2 meter amp(25 watts) and I have no problems at all. The freqs are correct 145.800 downlink-receive) and 145.99 (uplink - transmit). If you can set it up, try to listen to the audio that your TNC is receivng during your contact. I don't bother with correcting for the doppler shift of the freq or anything. I usually am able on a great pass of 30-50 degrees elevation to send several APRS packets during the 5-6 minute window while it is in range and have even connected to its BBS. Even passes on a much lower elevation of 5 degrees above horizon or higher are workable but eh window may be shorter. The call sign of the ISS APRS is RS0ISS-3 but it responds to ARISS as its alias. I have found that UIVIEW32 software will work, but it is cumbersome. I have discovered a free version of a program called UISS that is specifically for working quick bursts of packets to the ISS. This software allows you to tx just a quick APRS corrdinates packet and a brief message with the click of one button.
I have seen most people send to CQ with a path of ARISS, WIDE2-2.
If your packet is successfully repeated by the ISS you will see your message echoed back with a Substitute id of RS0ISS-3* in the path.
That means your packet was heard.
The ISS also runs a BBS message forwarding system with callsign RS0ISS-11 and you use standard commands to send a message:
Example:
W KC4TWO tells it Write a message to KC4TWO
Then it responds with prompt of SUBJECT:
Enter your text
Then it responds with MESSAGE:
enter your message (very brief) and /EX to end it.

Its really fun and the pursuit of the station is really more fun to me than the actual "Hamming" that goes on through it. Most messages back and forth to other hams are "good to see you again...catch you on the next pass....", etc. But tracking and hearing it are the really neat things about it to me. Good luck
Kent

From: Christopher A. George
Topic: 1568 Message: 1568

I wish to thank the moderator for letting me join the group, and his nice welcome.

I have been involved with APRS since 1997 followed shortly by becoming the EC in Grainger County. After moving to Anderson County in 2002, I turned the reigns over to Ed W4VGI as he was my AEC.

I find APRS to be a useful tool for anyone involved in Emergency Services, especially Skywarn, and incourage all Hams to get involved.

The only down side was the shift in Frequency of 1.5 Megs. A lot of the Digi owners at that time did not want to change out the E-proms and thus we have lost the magority of the Nation wide network we once had. APRS is alive a well in the SE United States, and I am Proud to be part of it.

UX-7 is the name given to the balloon's payload. AA4UT-11 is the
callsign it transmitted while in operation. Much like my name is Greg
and my callsign is K4HSM

David,
FB on UX-7. The Unaka Mtn. SAR unit was frustrated that they didn't get the balloon. They got the folks across the river, but i think they'll like to try to help retreive it, if they come up again. The SAR unit is mostly hams. They have climbing gear. If they plan another trip, have them to call the Unicoi Co. Sheriff's Dept. and ask for Doug Boone.

Bob,

Thanks for the info. I called Clyde Bryant this past week, as I was going to come this past Saturday. So, not sure if he is involved with that group or not, but he said he'd mention it to them.

Although this past weekend was scrubbed, I'd like to try a re-schedule for this Saturday. If we have any takers, I'm planning on leaving early again. Bob, if you'd like to mention it to them, I'd love more people to help us out.

Thanks!

From: David Hoffman
Topic: 1573 Message: 1586

Are you saying that they made an attempt to retrive the payload or are you commenting on how they helped some of?us accross the river?? They were all invited to climb the hill and help us get it down, only one took us up on that.? It's my understanding that they were going to try and turn it into an exercise for themselves and try and retrieve the payload as a group effort.? Was that done?? If they did get it, they were going to call us.? So as of now, I assume it is still up there on the mountain.

1589. Location of Local Repeaters

Yahoo group: EastTNAPRS
Date: 2006-03-17 18:51:53 UTC
From: William McKeehan
Topic: 1589 Message: 1589

Does anyone have a list of the local repeaters with their
Latitude/Longitude?

I imagine SERA would have this information for all of the repeaters
that they coordinate, but is this information available?

I would like to use it to 1) populate a map and 2) use this informaion
with Digi_Ned to tell mobile APRS users which repeaters are close to
them (upon request).

Any help would be greatly appreciated!

1591. NEW Widen-n system

Yahoo group: EastTNAPRS
Date: 2006-03-19 03:06:59 UTC
From: William McKeehan
Topic: 1591 Message: 1591

This following message was posted to another group that I participate in. I found it to be a good explaination of the new WIDEn-N system and thought it would be valuable to share here.

---------- Original Message ----------
Subject: [wtnaprs] Re: Routing question
From: "Richard Montgomery" <kb4ytm@...>
Date: Mon, March 13, 2006 8:00 pm
To: wtnaprs@yahoogroups.com

The NEW Widen-n system was designed to help prevent duplicates that were being caused by the older settings of RELAY and WIDE.

Most APRS software used to set you up as RELAY so that other users near you can use your home station as a 'relay' to help reach the distant digipeaters. Users could then use a path of RELAY,WIDE and your home station would digi (repeat) this packet to the higher elevation digi's in the area. This design worked ok when there were hardly any users and even fewer digipeaters (The star on your screen with a 'S' on it).

But now the airwaves are crowded, and using a path of RELAY,WIDE would cause duplicate packets. The path of RELAY would be digi'd by more than 1 home station, and the higher elevation digi would then repeat the same packet over and over, reducing channel capacity considerably. RELAY was replaced with WIDE1-1, so now a path starting with WIDE1-1 means to use home stations to help packets reach the higher digi's. I will get into that later, as I just want to give a general
understanding of how the new widen-n works.

Now we use WIDEn-n. What this does is simple. The digi responds to a WIDE2-2 packet, inserts its callsign into the packet, and sends it on its way to the next digi. So it looks like this:

This is what you send
WA4SCA>APRS,WIDE2-2 hello everybody

The first digi does this
WA4SCA>APRS,DIGI1*,WIDE2-1 hello everybody

See the digi inserted itself in the packet (as seen by the * next to the callsign of the digi) and sent it out as WIDE2-1. The next digi sees it and does this:

WA4SCA>APRS,DIGI1,DIGI2*,WIDE2 hello everybody

So now the second digi has responded to the packet, inserted its own callsign in there, and sent it out as WIDE2 (WIDE2-0 actually, but it drops the -0 since there are no more hops left to go)

And then your packet stops right there. It doesnt matter if 10 more digi's hear that last packet, they wont respond to it because it has used up all its hops.

Now if more than 1 digi hears the initial packet from you, or the first digi hop, then it would also send it back out, but it wont duplicate itself because the digi's respond to WIDEn-n in a 'smart' way, meaning it knows it has already sent the packet, so it wont send it again.

I hope this isnt totally confusing. If it is, I would be glad to give more help via direct email. The best thing is to look at traffic coming from your radio and tnc/soundcard, and try to see what is happening in the real world. Thats the best way to learn this stuff. It takes time so dont think you have to totally understand how your packet gets from point A to point B before you get into APRS.

I will post some real world examples below that I see on my tnc right now, and hopefully it will make some sense.

From: William McKeehan
Topic: 1590 Message: 1592

It does give me a start. I will be working with this list in the next few weeks and hope to have it interfaced with my DIGI_NED station before too much longer.

If anyone has the lat/lon for repeaters that are not listed at the following web site, I would appreciate knowing the info.

Thanks!

1593. Sunday night net

Yahoo group: EastTNAPRS
Date: 2006-03-20 02:02:57 UTC
From: William McKeehan
Topic: 469 Message: 1593

Well, participate in the Sunday night nets has been very light over the past couple of weeks. The number of checkins is not soo low, but the amount of discussion is very low. Even this week, with me introducing a few topics, there was very little discussion.

Has the net ran it's course? Is it time to discontinue the net?

Come to think of it, this group has seen very little discussion over the past couple of months also...what's going on? Is everyone that wanted to get active with APRS active no and happy?

Let me know your thoughts...

Thanks,
William

William,
I think the net should be there as it was when I needed it!!! I
would have never got aprs working here in my shack with out you and
the others on the sunday net. What I learned has opened new doors to
me in other digital modes. I felt like I was being a pest and taking
up all the net time when I first started working on aprs. Your the
driving force behind the net so if you don't want to continue it then
I understand but I really wish it could be there for the next new ham
that shows up with nothing but questions, and you dont know whos
listening and learning but won't take the plunge and ask , I know I
listened for a number of nets before I spoke up. I didnt want all you
to see how dumb I was...

Thanks, Jay KI4MZG

I don't respond to alot of the emails on here, but this one I had too. William, back in my "hay" day, I used to net command 2 or 3 nets a week. As time goes on toward the warmer months, you will find that net participation will go down in numbers due to people doing things outside, especially when daylight time increases. A net never runs it's course. You would probably be surprised on how many people listen. As long as you're able to help just one person, especially someone new to APRS, it's worth having, You might think about running the net every 2 weeks during the warmer months in that regard, but wouldn't totally do away with it. I haven't participated alot lately either, I've had alot going on. But it is nice to have around. You can think about having other people running the net, I wouldn't care to do it, Moe would do some. Don't be discouraged, it's just how things are when cold weather ends and everyone wants to be outside.

From: Scott
Topic: 1589 Message: 1598

My opinion based on facts for reporting repeater locations:

(1) Tower locations can be found on the FCC website if you know how to do it.

(2) There is a theft ring in the US that is going to tower sites and stealing copper items, such as wave guide and heliax. They are also breaking into tower buildings and leaving the sites open and unsecured when they leave.

(3) The company that furnishes tower space for our repeaters has been hit, although not locally, and to respect their wishes, it would be better not to post the positions of their towers.

(4) The crooks found locations of towers by going to company web site listings of locations. Many companies no longer list their tower site locations on their web sites.

(5) There was a local repeater stolen off a site in E TN last year.

These are facts, and the opinion is mine.

William;

Maybe we should announce the presence of the APRS net on other nets that we are on.
There may be others interested in APRS that do not know about our net.

We have a regular weekly schedule now and I hope we do not depart from it for I may not be able to remember when the net will meet.

1606. Re: Location of Local Repeaters

Yahoo group: EastTNAPRS
Date: 2006-03-21 18:20:18 UTC
From: William McKeehan
Topic: 1589 Message: 1606

I would agree that broadcasting the location of repeaters may not be
a good thing.

So I modify my solution as follows:

If I know the location and range of the repeaters, then when an APRS
user sends a message to my DIGI_NED station asking for a repeater,
then I would respond with a list (not the location, just Frequency,
Offset, Tone) of repeaters that should be in range.

KI4HDU-2 currently responds to ?VHF or ?2M with two messages; "146.940
(-)" and "146.850(-)" (note, this only works via RF, not via the
internet)

In this case, only the operators that run the DIGI_NED stations in
this configuration would need to know the location of the repeaters.

Does this seem reasonable?

You mean you can actually create your own set of commands that your digi will respond to??
Can you excute any code or a program that can generate results based on parameters passed
to it through a special code?

Yes! DIGI_NED is a wonderful tool.

For example, try sending ?WHOIS <CALLSIGN> to KI4HDU-2.

For a complete list of commands available from KI4HDU-2, send ?Help.
If you have suggestions for additional functionality, feel free to
pass them my way.

From: Hal Weeden
Topic: 1589 Message: 1609

I agree with Scott and Moe that tower locations should be protected to the extent practical, keeping in mind that those locations are already a matter of public record. However, I think William's idea is a great one, and would work a lot better as he originally proposed rather than giving a list of repeaters in the entire area.

If I understood William's proposal correctly, he plans to load lat & long of the repeaters and use some sort of calculation to compare that location to the APRS user's location and populate the response accordingly. I think he could intentionally distort the tower locations by a mile or two and still get a useful and technically correct response to the query while protecting the tower equipment.

Just my two cents worth.

If I was a thief, and wanted to find a tower site. I'd start by looking for those blinking strobes. That would be a good indicator of to where a good location was.
And when someone ask us while we are converstating with them on the radio as to where the tower is, do we not tell them almost every time about where it is.
And why are we not worried that a thief will find our home and steal our equipment.
A theif is going to find what he wants and one way or the other.

there, thats what I think about that..

And as far as the sunday nets.. . .
If you stop them or just have them every other week. that might lead someone to think that APRS is not worth the time and effort of getting involved with.
I and most others could understand changing the date and time in an effort to attract more pertisipants. . .
but again. . . that's just what I think.

For anyone considering the innexpensive LaCrosse Weather Station like the one that I picked up @ Sam's Club, I thought you may benefit from someone else's experience...

---------- Original Message ----------
Subject: Re: [Xastir] OT-WX station
From: "Tom Russo" <russo@...>
Date: Wed, March 22, 2006 10:31 pm
To: xastir@xastir.org

You get what you pay for. $100 is the cheapest you can find any wx station for.

And to expand on that:

I hate my LaCrosse $100 Sam's Club Special.

I have no idea how well the thing works when the remote sensor is connected to the display unit with the cable connection. I have attempted since December to get mine working properly in wireless mode, and it is an exercise in frustration. The advertised 330ft range is nonsense --- my sensor is 20 feet from the base station, separated only by a window. It is rare for me to go a week without the two units losing sync --- once this happens, it takes multipe power-cyclings of both units and multiple activations of the "resync" feature to get it working properly again. Today the unit has lost sync approximately ten times, and I'm ready to smash it.

When it loses sync, the "mysql2300" program that comes with the open2300 package receives garbage data in the temperature and wind speed fields --- stuff like 176 degrees F outdoor temperature and 150mph wind. I had to hack the sampling program to perform range checking so that this garbage data didn't make it to xastir.

The barometer has no way of setting your altitude --- you set your relative pressure manually, and it uses some half-baked correction term to compute the change in relative pressure from the change in absolute pressure. I found that it required frequent re-entry of relative pressure when the absolute pressure changed only a few hundredths of an inch of mercury. This morning I finally got sick of it and coded the proper relationship between relative pressure, altitude, and absolute pressure into "mysql2300" --- now it ignores what the LaCrosse station says the relative pressure is, and just computes what it's supposed to be from the fixed altitude and varying absolute pressure.

(http://www.srh.noaa.gov/elp/wxcalc/formulas/altimeterSetting.html)

open2300db2aprs will just keep returning the last data it's received from the database, even if it's hours old --- so if your LaCrosse station loses wireless sync with its sensor, xastir will transmit stale information until you notice and fix the problem.

Sorry to rant. It was neat to get weather into xastir for a cheap price. But unless you're willing to deal with routing the phone cord from the outdoor sensors into your shack, this thing is not worth the headache. Before I smash the thing I'm going to have to get under the house and run some cables under the floor boards. Maybe that'll fix the issue. But you should be aware of how dicey these units are before deciding whether it's actually worth $100. IMHO the LaCrosse station is just a toy.

From: Greg Williams
Topic: 1613 Message: 1616

Is there any way to keep the weather map in UI-view's NWSGet utility from updating every 5 mins, especially when there's nothing going on?

I find that when it starts updating, it stalls my computer for up to 10 seconds while it updates the map. Flash animations, email, web page scrolling, etc, all "freeze" while the map is updating. Sometimes if I am playing a video in media player it will lock up my computer.

William,

We have used several differing types of battery protectors for this type of service. When they are working they work great. However we've never had one last an entire year. I look at them as just one more part in a vehicle to fail and cause problems. We didn't really need them until we started running 5 and 6 radios in vehicles. Combined these radios draw about 700 mA with the radio's off (curse of Public Safety radios, they draw a little current all the time). Our newest solution is to put relays in the power supply lines with coil's activated by ignition sense or a manual override switch. The relays seem to be the best fix so far. The other fix is to add a second battery with an Isolator. You run all the radio's off of the isolated battery.

From: William McKeehan
Topic: 1613 Message: 1619

What is the primary cause of failure for these units? Would they work longer if they only controlled a relay and not power to the radios directly?

I considered designing my own circuit with a simple 555 timer IC and a relay. I like this one though and might give it a try. I wonder if they will be available at the Dayton Hamvention?

Topic: 1613 Message: 1622

Last Saturday Travis, N4TJM, and a non-ham (close to getting his ticket) hiked back up "Devil's Looking Glass" outside of Erwin, TN and, armed with a sense of purpose, an eye for determination, and a pretty big potato gun, shot down UX-7 from it's perch on high to bring an end to the UX-7 story. UX-7 was launched February 25, 2006 from Cookeville, TN and travelled 170 miles due west to its final destination.

The video of the recovery "shot heard round the world" can be seen at http://balloon.utarc.org/ux7recovery.wmv

The video is 72 megs in length, so a broadband connection is needed to retrieve the video.

The potato gun went through the container and out the top. It dislodged the container from the plastic holder and then fell down a hill several yards. Upon arrival to the payload, the recovery team found that none of the electronics appeared to be damaged by the gun. The gun actually missed hitting the ballast container by fractions of an inch.

All of the payload has been recovered (except for the parachute) and plans to launch UX-8 are in the works. No final date has been set. A launch date of April 8 was initially planned but due to efforts building the circuit boards for the mission, UTARC is looking no sooner than Saturday, April 15. Data recovered from UX-7 will greatly assist with the mission efforts for UX-8 and beyond. Plans for mission UX-8 include better ballast control and sustaining of the payload at a set altitude of about 70,000 feet before returning to terra firma.

For more on UX-7, and missions past, present, and future, please visit http://balloon.utarc.org.

Greg,
You might try turn down your expire time so the objects disappear quicker.

I would also be interesting to know where you receive them from.

Topic: 1625 Message: 1631

The timer setting I was refering to is the RX settings in the program, i.e. in UI-VIEW, the Expire Time in the Miscellaneous setup window. And I partially agree with Moe on the need for OHX stuff. I was the one who suggested doing MRX / OHX / HUN. Really, with where WA4RYW is located, probably all that needs to be gated out is MRX. That will stop some clutter, and also a lot of packet traffic.

KF4CFO-7 also gates MRX / OHX / HUN, but with a path of RFONLY, so that data DOES NOT get digipeated at all. Only stations within range of KF4CFO-7's TX footprint see the objects. I may look at doing away with OHX and HUN here also. Our WX comes from Bradley, Hamilton, Meigs and Rhea counties. For stations local to KF4CFO-7, MRX is probably enough. Some stations in Rhea and Meigs might benefit from seeing OHX also, as the warning area just west of them comes from OHX.

If APRS takes off in the SE TN area, then an Igate local to that area might need to do HUN.

That is the beauty of Igates, all have the option of NOT using the default UNPROTO path. KF4CFO-7 has an UNPROTO path of WIDE2-2, but it's Igate is RFONLY. That way the real function of the Igate of gating "local" traffic and messages is achieved.

When we use APRS for Skywarn purposes, we all need to remember that the APRS function is going to be different during that event, and we may need to adjust settings accordingly. Same is true for a search and rescue, ballon chase, bike ride, etc. If a group was doing a search and rescue in a certain area, stations near that area might need to shut down wide area beacons and objects, so that all available packets could be used for that operation. Once it is over, everything would go back to "normal".

Hey APRS is a learning experience. Think of what APRS was in E TN a year and a half ago...it has definitely come a LONG way.

From: Scott
Topic: 1625 Message: 1632

Greg,

You weren't being deceptive. And it was not a bad call in judgement. I have rasied the same exact issue before. I can control only what goes on at my location and KF4CFO-7. All others, I can only offer suggestions as to what is seen on my screen. We all need to learn this basic principle...

"Just because I don't see a problem, doesn't mean there is not a problem. Because I don't see the problem, may mean it is worse than I think."

Cunfucious say "He who sees no problem has long skinny neck and legs, useless wings, and cannot see because of sand in eyes." hihi

I'm always open to suggestions. I'd say I spend an average of at least a day a month at KF4CFO-7 tweaking settings and watching reports come back as to what that change is doing. And if it doesn't work right, I either ask for suggestions as to how to fix it, try something else, or I put it back the way it was.

I'm unclear as to how you perceive this screenshot. Is it a good thing or a bad thing?

During sevier weather events, I like to run multiple APRS clients at the same time. I use one that shows me a large view (800 miles wide, centered around Nashville), with weather radar as the primary map and with limited stations/objects on it. I use another that shows me a smaller area (100 miles wide, centered @ my current location) with no radar, but with all stations showing.

What does everyone else do?

Good God Jim, excuse me.? Talk about crying.? I wanted to see what everybody was talking about.? So I clicked on the link and believe the picture has been removed from the server, hence the words "Not Found".? What's wrong with bringing this to Greg's attention?? Maybe it's a mistake, maybe Greg took it away for a reason.? How can I participate in this subject without taking a look at?the picture?

I can speak for the T2USASE server, Comcast has been in the dirt for over six hours. All services from the Atlanta hub are offline at the moment. As for the rest of them, maybe they're Comcast customers as well. :)

The latest shape files that I have are as follows.

Counties (dated 2 April 2006)
http://www.weather.gov/geodata/catalog/county/data/c_10fe06.zip

Zones (dated 9 May 2006)
http://www.weather.gov/geodata/catalog/wsom/data/z_14fe06.zip

Marine Zones (dated 2 May 2006)
http://weather.gov/geodata/catalog/wsom/data/mz10ja06.zip

Once you the shapefiles in place, Go back into UI-View and select File\UI-NWS
and start UI-NWS. When alerts are active they display on my map.

Downloading The Shapefiles
To be able to use UI-NWS, you need the NWS shapefiles for counties, zones
and marine zones. UI-NWS is useless without these files. They are the
shapefile sets prefixed "c_", "z_" and "mz". Each set contains three files
- .DBF, .SHP and .SHX.

If you have already downloaded these shapefiles for use with other
software, then you can use your existing files. Otherwise, you need to
download them from the NWS site. The starting page is
http://www.nws.noaa.gov/geodata/

The files seem to be frequently updated, so the direct URLs for the latest
versions change, but if you start at the above page, you can find the files
by following these links. NOTE - Read the following carefully! The wording
of the link names is correct, but an awful lot of users seem to assume that
I have made a mistake, and so download the wrong files.

Zones
NWSI Libraries: Zone Forecast Areas, and then Public Forecast Zones
(CONUS/OCONUS), Download Compressed shapefile.

Marine zones
NWSI Libraries: Coastal And Offshore Marine Zones, and then Coastal Marine Zones including the Great Lakes, Download Compressed shapefile.

Counties
County Libraries: AWIPS Counties, and then US Counties (CONUS/OCONUS), Download Compressed shapefile.
NOTE - To get to this link, you have to scroll down the page! It is NOT the 'County Warning Areas' link near the top of the page!

When you have got the files, they need to be unzipped into a folder that will be created the first time UI-View32 V1.5 or later is run. The folder is \NWS\Shapefiles in the UI-View32 program folder. Make sure you put them in the correct folder, or UI-View32 will not find them! You can tell if you are putting them in the correct folder, because it will contain a file called "Put the NWS shapefiles in here.TXT".

if you have already downloaded the NWS shapefiles for use with another program, then you can tell UI-NWS and UI-View32 to use the shapefiles in a different folder to the default folder, and so avoid having two copies of the files on your PC - see Using Existing Shapefiles.

1647. Frequency Reporting by APRS

Yahoo group: EastTNAPRS
Date: 2006-04-10 19:20:57 UTC
From: William McKeehan
Topic: 1647 Message: 1647

Following is a note sent to the APRS Sig on the tapr site from Bob, WB4APR. I think adding the frequency that you are listening to to the first part of your status message seems like a good idea.

What do you guys think? Are there problems with this approach? Will you use it?

---------- Original Message ----------
Subject: [aprssig] [WOTADB] Frequency Reporting by APRS too
From: "Robert Bruninga" <bruninga@...>
Date: Sat, April 8, 2006 10:20 am
To: aprssig@...

There is a move afoot by the ARRL to make it easiler to locate Hams' operating frequencies so they can easily be contacted. One effort, called WOTA for "who is on the air" is tied into logging programs.

But, of course, APRS already has a global system, so all we have to do is to include our operating frequency in our packets if we are actively monitoring a voice freq.

In the past, Frequency has not been particularly highlighted, but it is very important and useful for most mobiles because they usually have a live operator present and usually he is monitoring his favorite repeater. We just need to be consistent in how we report it.

This way, not only can you click on the APRS FINDU web page to see where someone is while mobile (live), you can also see what his voice operating frequency is too. In the future we hope to solidify this construct so that it can easily be parsed in the FIND data base too.

For example, see: http://map.findu.com/we4apr-9

You will notice my beacon contains the text:

"147.075MHz & VoiceAlert 14439"

The 147.075 is the local repeater I always monitor, but the "VoiceAlert 14439" is always guaranteed to work, since the APRS side of the radio is always

there and the volume is always up (though squelched
by CTCSS-100). But he can always be contacted
if within simplex range.

I would like to encourage all APRS mobile operators
that do consistently monitor a particular frrequency
to please include it in your packet and in the standard
format above so we can build a parsing system to take
full advantage of it.

The format is

FFF.FFFMHz....remainder of position comment text

Notice that this is exactly 10 spaces which is also
perfectly matches the 10 character wide window
on the front panel of the D7 and D700 radios,
making it a pleasent display of someone else's
operating frequency when it comes in.

Notice how my beacon is also carefully crafted
to show the Voice Alert info also. Here is how it
flashes on the D700 panel on recepit:

WE4APR-9:
147.075MHz
-VoiceAlrt
144.39

On the D7 display only the first two
lines are displayed:

WE4APR-9:
147.075MHz
-VoiceAlrt

Anyway, I would like to encourage everyone to
begin using this format. If we can standardize
on it, then maybe we can get future radios,
and HAMhuds and other display devices to not
only display this info, but to automatically insert
it into our packets whenever we change the radio
knob.

Someone even wrote a little PIC device to hang
on the D700 serial port to query the radio's
frequency and then to write it into the radio's
transmitted beacons. This way, the person's
operating freuqency was always known, even if
he QSY'ed.

For more info on this, please see:

http://www.ew.usna.edu/~bruninga/aprs/freqspec.txt

1648. Re: [EastTNAPRS] Frequency Reporting by APRS

Yahoo group: EastTNAPRS
Date: 2006-04-10 19:46:51 UTC
From: David Hoffman
Topic: 1647 Message: 1648

I like the idea, but I'm a little confused on why he sticks the 144.39 part in the text message.? He talks about using the first 10 characters for the frequency that one could be monitoring to get contacted on.? That part makes sense to me.? Then he goes into this Voice Alert part that he describes which doesn't make it to a D700's display.? So why use it?? Seems to me the first 10 characters is good enough, then you can go with your normal text status message.? The words Voice Alert can show up on the D700 display, but he talks about it with this 144.39 thing.? Well that's a given if your on the national APRS frequency.? Any thoughts?

1649. Re: [EastTNAPRS] Frequency Reporting by APRS

Yahoo group: EastTNAPRS
Date: 2006-04-11 14:19:14 UTC
From: William McKeehan
Topic: 1647 Message: 1649

I agree, it seems like the 144.39 would be obvious for APRS voice alert.

But as for using the first 10 characters of the comment line, I think I will start doing that...but there could be times when I forget to change it when I QSY...and there are times that I may change it, but the packet with my updated status has not made it out yet, so someone looking may see my old frequency.

I'm not sure it's a great idea...but it's an idea!

From: William McKeehan
Topic: 1650 Message: 1651

I think that's a great thing to do. It keeps the memory of the operator alive.

So what's that status of things APRS related in McMinn County? Last I heard, you guys had plans for a new digi or two and an IGate change. Have you made any changes?

From: Scott
Topic: 1650 Message: 1652

KG4FZR-7 will operate as a two way Igate for our local stations connected via Internet, as soon as I get the registration back.

No-Pone is still waiting to be put up. It is part of a voice repeater project in the same rack, so all of it will go up at one time. Hopefully, around the first of May or so. David's passing hit us hard, as he did all the repeater work and building, as well as tower climbing. Just set us back a little, be we is about to "git'er done"!

first ; Hi Matt welcome to aprs then let me say I am new and cant
answer all your ?s but let me jump in here
my aprs path lead me the same way..... internet , rf , then rf
only and thats where you will end up ...
if you send anything via internet aprs it will likely get sent out
through rf through a local , I dont know the name of them , I will
call them internet digis as long as your sent message is local and
then I think the local rf stations will see you on there map. many
will respond if there near cpu.
second ; there are local maps in the links area of this group I
used one of those and set a filter in my server set up of 200
miles ... um how to do this I have forgot but Im sure someone here
will fill you in. sorry thats all I have like I said I'm new to this
but everyone tried so hard to help me that I wanted to try to pay
back by trying to help you. good luck matt and I hope to hear from
you via aprs or any mode. sunday aprs net 146.940 - 8.00 pm local

To send a message from internet to RF, the path does not matter. The path on RF will be determined by the IGate that puts your message out to RF. I do this frequently when I am in Memphis. Give it a try, just pick a station and try to send them a message.

To limit the stations that you receive, the best way is to use a "filterd feed" from the internet. Here's the best guide to filterd feeds that I know of:
http://www.aprs-is.net/javAPRSSrvr/javaprsfilter.htm
Most aprs servers support a filtered feed on port 14580.

Also, the McMinn County Amateur Radio Club's web site has some good information for APRS setups that work well in our area and they include a page about setting up ui-view for an internet connection:
http://www.qsl.net/kf4cfo/aprs/inet.html
well worth the read.

1656. RELAY and WIDE1-1 in your path

Yahoo group: EastTNAPRS
Date: 2006-04-16 02:32:41 UTC
From: William McKeehan
Topic: 1656 Message: 1656

I have received some questions about KF4YMC's bulletin asking that we not use relay,wide1-1 together in our paths.

I agree 100% with Kevin and thought I would use this forum to explain.

We have some digis that we call "fill-in" digis. Fill-in digis are digis which hear well (or hear ares where the local large coverage digi does not hear), but are not heard by a large number of stations. The purpose of these digis is to help stations (primarily mobile stations) to be heard by the large coverage digi. These digi are configured to respond to either RELAY or WIDE1-1 or both.

(Side note: RELAY is old style, WIDE1-1 is new style. In the local area, we are encouraging both as we slowly make the transition to the "new paradigm".)

To use these fill-in digis, the mobile stations should use RELAY or WIDE1-1 as the first hop in their packet path.

To demonstrate how this would work in practice, let's say we have 3 fill-in digis (A1BC, D2EF, and G3HI), one mobile station (KI4HDU-7) and one large coverage digi (WA4KJH-7).

Using the recommended packet path for the Knoxville area (RELAY,WIDE), here is the packets that would be produced if WA4KJH-7 heard me direct:

```
KI4HDU-7>APRS,RELAY,WIDE <- original packet
KI4HDU-7>APRS,WA4KJH-7*,WIDE <- packet digi'd by KJH and heard by
local stations
```

If WA4KJH-7 did not hear me direct, but one of the fill-ins did, it would look like this:

```
KI4HDU-7>APRS,RELAY,WIDE <- original packet
KI4HDU-7>APRS,A1BC*,WIDE <- packet digi'd by a fill-in digi
KI4HDU-7>APRS,A1BC,WA4KJH-7* <- packet digi'd by KJH and heard by
local stations
```

If, however, I were to use a bad path of RELAY,WIDE1-1, here's what would happen if WA4KJH-7 heard me direct:

```
KI4HDU-7>APRS,RELAY,WIDE1-1 <- original packet
KI4HDU-7>APRS,WA4KJH-7*,WIDE1-1 <- digi'd by large coverage digi
KI4HDU-7>APRS,WA4KJH-7,A1BC* <- digi'd by fill-in digi #1
KI4HDU-7>APRS,WA4KJH-7,D2EF* <- digi'd by fill-in digi #2
KI4HDU-7>APRS,WA4KJH-7,D3HI* <- digi'd by fill-in digi #3
```

Notice the extra packets which add zero value since anyone that can hear the fill-in digi can also hear WA4KJH-7.

If you are setting up a fill-in digi using UI-View, you will want RELAY,WIDE1-1 in your digipeater setup screen, but not in your station setup.

From: Ron McCoy
Topic: 1656 Message: 1657

Thanks. Very clear explanation.

Side question: We have another car event coming up at Deal’s Gap. Has repeater or digipeater coverage made it to that area yet?

1659. Re: RELAY and WIDE1-1 in your path

Yahoo group: EastTNAPRS
Date: 2006-04-16 16:17:06 UTC
From: William McKeehan
Topic: 1656 Message: 1659

In the Knoxville area:

The recommended path for a mobile station is RELAY,WIDE.
The recommended path for a home station is WA4KJH-7 (or simply WIDE).

It is recommended that fill-in digis be setup to resond to both RELAY and WIDE1-1 (but not use this in their packet path). This is to give a little better coverate to out-of-town mobile stations that will have WIDE1-1 as the first hop in their path (i.e., those coming from areas where the new paradigm is in place - like Memphis and Nashville).

The recommendation for packet path for mobile stations has not changed for the Knoxville area for years...WA4KJH-7 has not changed his configuration for years. Asking the fill-in digis to add support for WIDE1-1 was done because in the last 12-18 months, much of the country is converting to a new system where RELAY is removed.

I think you're confused about PATHS - the packet path is where you should not use RELAY,WIDE1-1, in the UIView Digipeater setup, you are not listing a path, but a comma seperated list of alias - you could use "ABC,WIDE1-1,WJM,EVENT,RELAY" as the list of aliases in your digipeater setup. The packet path is the "path" that you want your packet (position or whatever) to travel on RF; the list of aliases in the digipeater is what aliases you want your digipeater to digi on.

Does that help clear it up?

1660. Deal's Gap coverage

Yahoo group: EastTNAPRS
Date: 2006-04-16 16:27:42 UTC
From: William McKeehan
Topic: 1656 Message: 1660

Yesterday, some of us from the Blount County ECS group did some testing of coverage on the dragon and beyond.

What we found was that for voice, the temporary UHF repeater that we setup over in NC did a pretty good job of providing coverage to the dragon area - I was using a mobile radio on high power to get into it and I was not in it solid all of the time, but enough to make it easy to find a spot to put out a call for support.

On our return trip yesterday afternoon, David - KE4FGW, was able to use the 146.940 repeater to call for some assistance at a point just south of parson's branch road. I found the 146.94 repeater to be noisy all along the route and eventually was unable to get into it with enough signal to be undersood.

As for APRS coverage, on the lower end of 129 (maybe just along the lake) there seemed to be a hole in the coverage. Once you get up a little bit, things picked up significantly. I think APRS will be something that we can easily use for the event for which we were testing (we also had a digi up at the same location as the UHF repeater).

Maybe some of the other guys on the list that participated in the tests yesterday may have some other comments.

Having 12 years in APRS, my advice is this. If you run the software, do what the software setup suggests. We tend to get in trouble when we ignore the new documents in the latest APRS DOS version. The link for those who want to be in the latest APRS "know" is at the tapr.org APRS SIG. Also, if you don't like spam buletins in your mailbox, enable your tnc's SPAM filter(BUDLIST).

In general, I agree with you.

Unfortunately, if you run what he software suggests in the Knoxville area, you will be disappointed. I've even discussed this with Bob (WB4APR) as he drove thru the area; he changed his path to RELAY,WIDE while he was in the Knoxville area.

The software has changed, but the local infrastructure has not yet updated to match.

This is one reason for the confusion/problems.

You can use older versions of Delorme Street Atlas and create over-
sized maps that you can scroll in UI-View, I believe there are some of
these in the files section of this group.

Probably the best mapping for UI-View is Precision Mapping. I have
seen it and it's really nice and not too expensive. It is commercial
software, so it would need to be purchased to be legal.

You're right, that is EXACTLY what the problem is. That's why I never see any stations in the Knoxville area from here in East TN and I'd bet you don't see us, either. I thought all these years you folks were a little behind the rest of us and didn't run APRS, as nobody can see your activity past your local digi's range. Sorry I thought that of you, but I really did. For the last 5-6 years I could on see about 2 or 3 stations in the entire Knoxville area. Some digis in East TN are bottlenecks for the rest of the network. A few simple tweaks or a fimware chip change and a little time are all that's needed to fix them. The new parms only work on digis with firmware that support wide#-#, such as the kantronics' kpc-3 plus tnc. The MFJ 1270 series digis can be updated to do this with a firmware chip change with a chip from paccomm(I think it's the spirit 2 model firmware, but you'll have to ask them which firmware will work in your mfj tnc to be sure).
Here's some good reading:

My opinion is that a digi with the ability to handle the new digi paths needs to be put up or a couple of them. You've waited at least a year to get the main digi in East TN upgraded/updated and it has not happened. How much longer is the group willing to wait? I had offered digi's when I first arrived in East TN but no one took me up on it. I am now returning to VA, so I can't do that now. BUT a YEAR ago, the group could have had at least 1 if not 2 complete digi's FREE. By group, I meant the EastTNAPRS folks.

I now KNOW that if I really want to see what is on APRS in East TN, I need to be plugged into the internet link. It is like night and day difference.

Best Wishes folks.

Bruce, et al,
All is going well with the Basic Stamp and camera setup. I tested the cameras with 4AA Lithium batteries over a period of 3 hours. I configured the basic stamp to take snapshots every 15 seconds and the batteries are still alive and kicking. It filled the memory cards of the cameras many times. I think 8 AA's will get the job done with room to spare. The AA4VU-11 tracker is functioning with the Holex GPS just fine. It looks like things are working good and provided we have no show stopping bugs (or other issues), the launch is a go!

Thanks Moe for the well wishes and the same to you and the group.

I do totally disagree with point (i know it was not your point) that East TN is gonna get so swamped if beacons outside the area are allowed in. My thinking is that East TN is sitting itself up to be an island onto itself and it WILL come back to bite residents. Actually, the island is already created, must of the time! There has to be a reasonable approach to this other than just a blanket statement approach making East TN an island in the APRS world as the only way to go. That makes as much sense as relying on the old much less functional digi's currently used. The reason that the old digi is still being used may be that it helps ensure the area stays an island. I believe there are enough reliable people in the group to make this area a first class APRS service, if they want to take the bull by the horns. BTW, this is saying absolutly nothing aganist William. He is trying just as hard as you are to make it all work!

I really hope you guys never have to provide any digital communications support to any areas out of the East TN valley.

I am sorry if my comments upsets anyone but I think the group needs to hear that there is a serious problem here and it is not going away until the group moves forward with some enhancements. You now basically have the equipment, so turn it on. Allow the folks around East TN to come in AND you all can get out of the hole to visit them. PLUS YOU WILL HAVE SOME EMERGENCY COMMUNICATIONS ABILITY SHOULD THE NEED ARISE. The argument that the world is gonna come running into East TN is not supported. Maybe some look-see folks in the beginning but that is gonna be it. Isolation is not gonna work near as well as some perceive it will here. I've been there, done it, it is not a good feeling. Step back and look at what you currently have and then think about all of it's limitations, particularly IF one small piece fails, god forbid in a time of serious need. Do something while you still have some people willing to help make some changes for the betterment of your network. Change can be very good. :))

Ugh...I was wondering that had happened to that potential digi in the Oak Ridge area.

I think it would be a great addition to the network. Once you get north of Knoxville, you can still get back into WA4KJH-7, but not reliably. I think that digi would be do a great job of filling the hole.

I don't think I disagree with anything you've said Ben.

I do believe that it will require somthing big to fill the shoes of WA4KJH-7. I've been pushing for the owner of that digi to update it to support the WIDEn-N stuff. It may happen one day - and yes, we've been "waiting" for that to happen for a while now.

My focus has been making what we do have work.

WB4APR says:
"The Automatic Packet Reporting System was designed to support rapid, reliable exchange of information for local, tactical real-time events or nets."

I agree 100% with Bob on this point, and given this point, we can (and have) successfully use APRS for local, tactical, real-time events in our area. As we get more stations with APRS capabilities involved in the events, we will be able to do even more.

I'm in agreement with you that things would be easier if everyone (there are other pockets of resistance other than just East TN) were on the same page with APRS.

In the mean time, I've recommended that all new digi's that go up (fill-in or otherwise) support both the old and new formats to help make the transition to the new stuff easier when we eventually do.

As I have said often, I've only been doing this stuff for 18 months or so and there are a number of people on this list with more experience than I. I'm certainly open to suggestions on how to improve things.

william,
i disagree with a couple of your points, but we're on the same page as far as wanting to reduce interference. first, all digis and stations should follow the latest setup format, not both. second, the network is not just "local" and we don't want to interfere with wide area traffic that may be out there, such a a few mobile stations. the idea is to reduce interference with the new format. the old setup is causing interference by allowing too many multiple repeats in a highly populated local network like knoxville and many other large cities. perhaps if the group in knoxville is getting too much traffic and that's causing problems for them, then that group could possibly set up a second qrm free frequency for local activities and events? the present digi would work fine for the local frequency and a new digi could be used for normal statewide, aprs traffic on 144.390 for the rest of us. the wide#-# digi setup is used to reduce dupes and all the extra traffic in a local network, not make it worse. "relay" needs to be dropped. period. the problem is simple. use the new setup parms and reduce traffic! i do agree with this... educate the users. actually, the guy using the aprs buletins could do it with a little tact and that buletin idea wouldn't be such a bad idea as it would target all active users. read and distribute the following from bob's website:
http://eng.usna.navy.mil/~bruninga/aprs/digi-users.txt
"OBSOLETE PATHS: We are trying to get away from the original paths of VIA RELAY,WIDE and VIA WIDE,WIDE type of multiple entry that generates many duplicate packets through the same digipeaters. Similarly, the path RELAY,WIDEn-N and WIDE,WIDEn-N are also obsolete."... from wb4apr's website above

1679. Re: [EastTNAPRS] Re: RELAY and WIDE1-1 in your path

Yahoo group: EastTNAPRS
Date: 2006-04-20 11:34:13 UTC
From: William McKeehan
Topic: 1656 Message: 1679

I agree that the new system would work better if everyone followed only the new settings, but with our big digi on the old stuff, setting all of the little digi's up to only support the new stuff would result in either those digi's or the big digi providing very little value. I'm only recommending the both configuration as a stepping stone to getting everyone over to the new stuff. I have discussed this with Bob and he agrees with YOU saying that running a dual system will simply delay the migration to the new system.

I do not think that the volume of traffic in Knoxville is an issue at this point. We don't have nearly the number of stations that they do have in the real high population areas (like DC and LA).

We do have an issue with multiple digi's of some stations packets. There are places where a mobile station will hit 3 fill-in digi's and with a path of RELAY,WIDE will result in up to 7 packets. Under the new WIDEn-N, this would be reduced to a maximum of 4 packets with the same coverage. So upgrading everyone to the new stuff would increas our available bandwidth and thus make it easier for low powered trackers to get in without collisions.

The things that Bob calls obsolete are only obsolete once the infrastructure upgrades to the new WIDEn-N stuff; we're not there yet, so we can't stop using the RELAY,WIDE path unless we don't want wide area coverage.

On Thu, April 20, 2006 1:07 am, Bob Thomas said:
> william,
> i disagree with a couple of your points, but we're on the same page as far
> as wanting to reduce interference. first, all digis and stations should
follow the latest setup format, not both. second, the network is not just
"local" and we don't want to interfere with wide area traffic that may be
out there, such a a few mobile stations. the idea is to reduce interference
with the new format. the old setup is causing interference by allowing too
many multiple repeats in a highly populated local network like knoxville and
many other large cities. perhaps if the group in knoxville is getting too
much traffic and that's causing problems for them, then that group could
possibly set up a second qrm free frequency for local activities and events?
the present digi would work fine for the local frequency and a new digi
could be used for normal statewide, aprs traffic on 144.390 for the rest of
us. the wide#-# digi setup is used to reduce dupes and all the extra traffic
in a local network, not make it worse. "relay" needs to be dropped. period.
the problem is simple. use the new setup parms and reduce traffic! i do
agree with this... educate the users. actually, the guy using the aprs
buletins could do it with a little tact and that buletin idea wouldn't be
such a bad idea as it would target all active users. read and distribute the
following from bob's website:
> http://eng.usna.navy.mil/~bruninga/aprs/digi-users.txt
> "OBSOLETE PATHS: We are trying to get away from the original paths of VIA

RELAY,WIDE and VIA WIDE,WIDE type of multiple entry that generates many duplicate packets through the same digipeaters. Similarly, the path RELAY,WIDEn-N and WIDE,WIDEn-N are also obsolete."... from wb4apr's website above

I'm not sure what you mean by running a path of SKYWARN, but I would like to see the digi go up. If it is bringing in too much traffic from out side the area, there are things that can be done to slow that down.

I don't think we know what it will do until it is up.

On Wed, April 19, 2006 10:44 pm, Moe Brewer said:

Bob,

We all know that we should not be using both digi setups BUT unfortunately, we have the main digi using the old setups. William is simply trying, as he says, to work with what he has, the best way that he can. IMHO that should NOT stop the placement of digi's that support the new format now. Waiting for the upgrade of the KJH digi is like watching paint dry.. :))) The placement of the new format digi's will allow people to switchover to the new format which will result in greatly reduced traffic using the old format, provided all people who can use the new digi's actually switchover to the new format. Simple procedure guys! :)) I normally keep my UI-View map on what Ui-View thinks is a 36 mile radius and I am not seeing all the stations/traffic that is being reported. At that range it actually looks rather barren when looking at the whole map. When I kick it out to 72 miles, then it really gets barren!! Now, I KNOW that the KJH digi and I don't copy (decode) each other well, so maybe that is why I am not seeing this traffic being talked about. I have tried another totally different complete system using a beam aimed at KJH with the same results. So as I've learned also, I live with and work with what I got until it is changed. But since I only have a month left, I may miss the big changes. :))

William for some reason, I don't get all the msgs addressed to the group, such as yours below. I know it is not your fault but just a FYI in case you were wondering why I did not respond to you.

Good luck guys.

From: David Hoffman
Topic: 1682 Message: 1682

More on the couple of flights coming up this weekend...
David Hoffman - KE4FGW

---------- Original Message ---------- Subject: [tnballoon] Re: Balloon launch this weekend
From: "Bruce W. Martin, KQ4TV"
Date: Thu, April 20, 2006 12:37 pm
To: WB8ELK@...
Cc: "Jason Winningham"
"Terry Trapp"
tnballoon@yahoogroups.com

My plan was to run the trackers (AA4VU-11/-12) at 1 minute intervals and a path of WIDE1-1,TN2-2 below 3000' and 30 second interval and direct path above 3000' using timeslots of 10 and 20. I can certainly change that if you think it is excessive or that a different timeslot setting is better for the coordination.

It is looking like it will be favorable to launch from Mt. Juliet (36.19658, -86.45558) rather than Spring Hill (35.74713, -86.93038) this time. Much more convenient for me.

Bruce, KQ4TV

> coordinate the timing. Unfortunately I don't have an exact total weight, but we are going to use a 1500gm balloon, a 62" chute and I think the total weight of all payloads and the chute will be about 6 pounds. We are also going to live dangerously and use hydrogen gas. Any of your predictions will be much appreciated.

From: William McKeehan
Topic: 1656 Message: 1683

The 30 minute rate is one generally recommended for home stations. I don't think that's too much unless the path is excessive. Around here, 2 hops (i.e., WA4KJH-7,WIDE2-1) will get your station on the screens over a large area (into GA, KY and near Nashville). That is the longest path that I would recommend for anyone that can hit WA4KJH-7 direct.

As for mobile stations, I like the 2 minute rate in general. Sometimes I will run something more often, but that's generally only for special events or to do some testing.

1686. State of APRS in North East TN

Yahoo group: EastTNAPRS
Date: 2006-04-20 19:48:16 UTC
From: William McKeehan
Topic: 1656 Message: 1686

Bob (really, anyone in the North East part of the state),

You have a digi near Erwin, correct? I have a number of questions about APRS in that area, maybe you can help me with some information.

Your digi has an "S" overlay. Can you tell me what all that indicates (i.e., how it's configured and what it will/will not respond to)?

Can you tell me which stations you hear direct?

What area does your digi cover?

Are there any/many mobile stations up there?

Have you guys used APRS for any events?

Is there an IGate anywhere up in that area?

Do you know anything about the W4FXO digi up near Bristol?

All I know of that area is what I see on the internet. I don't see much on the internet, so I assume I'm not seeing the complete picture.

Thanks for the information (I can ask a lot of questions in one e-mail, can't I).

Cc: "Ralph Wallio, W0RPK"

Just an update on the launch location.

The TABEL-2 launch will be ~10:00AM outside Mt. Juliet in Robin
Midgett's (K4IDC) back yard.

Decimal Degrees: 36.19677N 86.45620W
Degrees/Decimal Minutes: 36 11.806N 086 27.372W
Degrees/Minutes/Dec. Seconds: 36 11 48.4N 086 27 22.3W
Universal Transverse Mercator: 16S 0548890 4005910
Military Grid Reference System: 16S EF 48890 05909
Maidenhead Grid Locator: EM66se

Robin Lives on Beckwith Road near East Division Street. This is about halfway between Mt. Juliet Road and Highway 109.
I will be monitoring the 444.775+ pl107.2 repeater if anyone needs help finding the place.
Current landing predictions are in the Smithville, Crossville,
Dayton, Tennessee Triangle. Better estimates as we get closer to launch time.
Anyone with experience using Hydrogen as a lifting gas is urged to attend or give comment/recommendations.

Bruce, KQ4TV

go to: http://web.usna.navy.mil/~bruninga/aprs/kpc3+WIDEn.txt The rig is an early kpc3+ with updated firmware and is setup pretty close to Bob's parms above. The suggestion came from Richard in Nashville...They are getting it together down there and have a neat website for APRS: http://www.nashvilleaprs.net/apps/phgcalc.php They noticed my old setup, made a suggestion, so I changed it. It had been untouched since 98 and was sending id packets into the network. It sure took a long time for anyone to speak up about it last November/December. The radio is an Alinco DR-140, ps is RS-20, ant. Is a simple ringo 5/8~. The "S" indicates updated to the latest wb4apr parms and is explained in the above WB4APR (bruninga) text link as to what it responds to and how it works.
> Can you tell me which stations you hear direct?
My qth rig is down, or I'd give you a good list. It is very busy. This digi is a good link between the Carolinas and Virginias.
I usually see 2/3 of the Carolinas, sometimes all the way to the coast, south to Atlanta, and north to Ky., Va., and w.Va..
> What area does your digi cover?
Upper East TN, Erwin, Johnson city, Bristol, Flag Pond(QTH), W. North Carolina. It doesn't cover NC roads well over the mountain, but it links up the digis over there to ours. It covers I-26 from NC to Johnson City pretty well.
> Are there any/many mobile stations up there?
mine, several others.. Mine is also portable capable. We have a lot passing through on nearby I-26 and I -81
> Have you guys used APRS for any events?
Mostly search and rescue with the Unaka Mtn SAR group, bike races, etc. For example, I once put a chopper that was off course by 11 miles right on top of a stroke victim on the Appalachian trail in a remote area. It saved his life. All I had to do was look at my map and relay the posit to the SAR group. I've used this for ARRL SCR and worked sats from the school I teach at and got a grant for my school station equipment from the TEA. One night

when there was only two of us doing aprs up here, we got our maps lit up like a Christmas tree with posits digied via meteor scatter. That was way cool... we new there was someone else out there! I was running an 8 element h. brew quad and heard most of the posits via a nashville digi. After that it was just a matter of time. The tapr sig group also let me know there was other activity in our area.
> Is there an IGate anywhere up in that area?
Knoxville, S. Carolina, we also see wx stations in Spartanburg, SC.
> > Do you know anything about the W4FXO digi up near Bristol?
None, except it's like the Knoxville digi, has good elevation and the old setup.

1690. East Tennessee map

Yahoo group: EastTNAPRS
Date: 2006-04-21 11:20:27 UTC
From: Matt
Topic: 1690 Message: 1690

Can someone please make a map, using Virtual Earth or maybe Google maps, that show East Tessessee. I am looking for major highways and towns included.

Thanks,

Matt

PS: There is one on here, but it is backed off too much for what I need it for.

Do you know if you can hear WX4MRX direct? What about WA4KJH-7?

Looking at the internet, I don't see much stuff up that way, maybe the nearest IGates are either too far away or in Knoxville and don't hear your stations because of the paths used. I do see the digi, but not much else.

Maybe adding an IGate in that area would be a good thing.

I'm pretty sure I can hit KS4NG direct from my house. I could easily provide an igate with a little guidance. This is something I may look into this weekend, as I am in the process of assembling another computer and TNC for this very reason. When I get igated I don't know where, but I don't believe it is anything local.

I want to do some testing with this this weekend, If I can hit KS4NG direct, what would my settings need to be to igate packets heard from that station as well as any other local activity? Are there any good tutorials or guides on this subject? I will most likely be running linux....

Linux is what I run, so I may be able to give you some help.

There are 3 options that come to my mind:
javAPRSSrvr
aprsd
Xastir

I run javAPRSSrvr as my IGate and have been pleased with the performance and ease of configuration. The fact that the author of the software gives you a default config file that he customizes for your situation gives you a great place to start.

I have not ran aprsd, but am told it's a good one also.

Xastir is focused on the user side of things, but has the IGate functionality available on a limited basis.

I think it would be good to have an IGate up in that area (even if it was listen-only) and would let people like me see what all is going on in that area.

Let me know if I can be of help to you in getting this going.

That would be great! I will hopefully get the TNC done tonight, I am building a homebrew TNC based on a PIC 16F88 microcontroller. I think it will work real well for my intended usage.

Also, this may be a silly question, but as I don't know I need to ask, if I setup an igate running off what I want to dedicate as my APRS radio, will I also still be able to operate APRS as normal? Or will it be RX only mode at that point?

Or alternatively, do any of the applications you mentioned use TCP/IP? For example, let's say I have my home APRS station up and running as normal, I take all received packets via RF and then send them to a server running an igate and then on to the internet. I will most likely be running xastir on my station computer, can I send received packets to another server on my LAN running APRSD or equivalent and then onto the internet?

The simplest hardware to put up for a digi would be a Kantronics KPC3+
and a transceiver.

What is the potential location of the digi? Will it be at the guys
house or on a remote tower somewhere?

From: Greg Williams
Topic: 1697 Message: 1697

I was getting a stuck carrier a few mins ago and its been keeping me from receiving traffic.

I'm not sure but I was thinking it was coming from one of the two weather balloons launched today (one near Nashville, the other in Huntsville).

I'm getting very few packets right now registering on UIView.

Roy,
I am sorry to the group for using this group for this post but it was the only way I knew to get message through to Roy. This is Jay , ki4mzg and I talked shortly to you thursday night after the blount county ares net on 146.940 and my wife and I have talked and would really like to get involved in ares in our area. We would also be interested in helping out with some of the activities you mentioned thursday, as in the help with up coming bike rides or any way we could help out in future events planned. ki4mzg Jay ki4ofi Jackie email is jaysellsw13@... . any info you could give would be great!!!! Again sorry for using this aprs group to past outside intrest info I hope you all understand.

From: Christopher George
Topic: 1656 Message: 1700

Hi Moe, William and the rest,

I can sit by no longer, without stating my piece. ;-) . I have been involved with APRS since 1997. Yes the system is broken, and yes nobody wants to try to fix it, except ppl like Moe, William, Ben, Jeff and a handful of others.

After WO4U moved out of the area, APRS in East TN went to Hell in a hand basket.

For the ones that can remember, Ken - KC4YDQ, he had an excellent digi on Clinch Mtn (KC4YDQ-7), in Grainger County, but the Club I belong to has taken it down, for whatever reason (I am no longer one of the movers and shakers in the Lakeway ARC), just the Hamfest Chairman, and main contact for APRS in the club.

We need to update all the OLD digis or take them out of service, I can remember when I could talk to operators on the West Coast, NJ, TX, NM, FL, etc.... via VHF APRS with no problem, that was before AMSAT had us move down 1.5 Megs in frequency. and even after that, the digi owner who did change their E-proms still gave us decent coast-to-coast coverage.

As far as being able to hit the WA4KJH-7 digi, I have no problem and I AM North of Knoxville, right at the Clinton/Norris Exit. No problems here. But maybe a fill-in digi would help the western part of Anderson Co, and maybe Morgan Co, I don't know, don't live there.

Just my 2 cents worth.

1702. [Fwd: [Balloonatics] TABEL-2 Lost]

Yahoo group: EastTNAPRS
Date: 2006-04-24 17:27:32 UTC
From: David Hoffman
Topic: 1702 Message: 1702

Well Greg, this answers your dead carrier idea about one of the balloons on Satrurday.
David Hoffman - KE4FGW

---------- Original Message ---------- Subject:
[Balloonatics] TABEL-2 Lost
From: "Bruce W. Martin, KQ4TV"
Date: Mon, April 24, 2006 2:41 pm
To: tnballoon@yahoogroups.com
Balloonatics@yahoogroups.com

I am sad to announce that the second flight of the Tennessee Balloon Group,
TABEL-2.
(Tennessee Area Balloon Experimental Launch #2)
is lost.

The last position reported was:
36 02.810N 085 32.910W 9462ft 18mph 171deg. EM76fb

We believe it landed in the vicinity of Burgess Falls Road and Milk Plant Road in White County, Northwest of Sparta, TN.

Decimal Degrees: 36.00713N 85.54033W
Degrees/Decimal Minutes: 36 00.428N 085 32.420W
Degrees/Minutes/Dec. Seconds: 36 00 25.6N 085 32 25.1W
Universal Transverse Mercator: 16S 0631549 3985725
Military Grid Reference System: 16S FE 31549 85724
Maidenhead Grid Locator: EM76fa

At about 79,000 feet there was aperantly a malfunction in the
AA4VU-12 tracker that caused it to continuously transmit a carrier at 5 Watts. This drowned out the <1 watt AA4VU-11 transmitter.
It would seem that something jarred loose on landing as by 1:45 PM CDT everything went quiet.

Because of some conflicting predictions we did not have people in the area to view any part of the descent and because of mistaking the last packet as being 94,000 instead of 9400 feet we searched in areas that were way out of range for possible landings. A search of the area on Saturday afternoon until sundown and for 6 hours on Sunday afternoon.

We have spoken with a few residents of the area and posted a reward poster in a nearby corner Market. We are hoping someone finds it and contacts us.

The use of Hydrogen as a lift gas went well. We had barely enough gas to give us the 3lbs of free lift we were looking for. But Early
beacons seemed to confirm we were getting the 1000 fpm ascent rate that we were hoping to achieve.

Bruce

From: "Daniel Bowen" <dbowen1@...>
Date: Thu, April 27, 2006 2:50 pm
To: balloon_sked@...m

The University of Tennessee Amateur Radio Club will attempt to launch mission UX-8 on Saturday May 13, 2006. Launch location will be middle or west tennessee. Active altitude control will be tested: software will attempt to level off at 70,000 ft and perform several altitude deviations and returns to that altitude over the course of 2-3 hours. 2m APRS, 70cm voice, and 20M CW beacons will be aboard. More info is available at http://balloon.utarc.org Thanks,
Dan Bowen

uh oh.... forgot. some of us don't open attachments. so, here's the plan
from wb4apr's website....and i will be upgrading the ks4ng-7 digi AGAIN
soon. it needs some more tweaking. i shoud have done the hard reset!
there's more at: http://web.usna.navy.mil/~bruninga/aprs/
for what it's worth, Ken, kc4ydq (SK) helped setup the first WX packet
network in East TN, linking Morristown, TN with Erwin, TN on 145.650
several years ago. i gave him a computer in 1999 when his quit. he was
helpful to us all and an elmer sorely missed. also, bobby, kc4ovg is
now SK. Bobby was a member of Unaka Mtn SAR and captain of the
Unicoi Fire Dept. and a fellow packeteer. now where are all those tnc's
i have to reset...

bob thomas, ks4ng

From Bob, WB4APR:

New n-N PARADIGM TRANSITION PLAN 3 April 2005

Most of the New n-N Paradigm is already in place everywhere because
WIDEn-N is supported everywhere to some extent. SO the biggest
improvement is made by simply educating users to USE it! That is, get
every one to STOP using the old RELAY, WIDE, TRACE, TRACEn-N paths and
start using the new simplified WIDE2-2 in most areas or WIDE3-3 in less
dense areas.

Similarly the sysops of the digis can implement the better BEACON
algorithms and beacon paths for their digis immediately. Then can also
add the UIDIGI ALIAS traps for large N's immediately to start trapping
out abusive packets with large N's. Also the SSn-N state or section
digiepating can be added immediately. To this point, no local users
are impacted.

But to get users to change, here is a possilbe scenario:

1) POST A SHORT two line BULLETIN for a few weeks saying:
"RELAY and WIDE are being eliminated"
"Please change to WIDE2-2 path" <== or 3-3 if OK in your area

2) Watch the network packets. Contact every user of RELAY,WIDE paths
either by APRS message (if message capable) or via Email or via QRZ.com
Tell them about the change and suggest they switch to WIDE2-2... or
if they insist that they need RELAY,WIDE, then ask them to just try it
for a week or so and see the results, reminding them that it will
improve as everyone else switches over.

3) If they still think they need RELAY,WIDE so they can get out in their own home area, suggest that they set their RELAY-only digi to WIDE1-1, and then use the WIDE1-1,WIDE2-1 equivalent.

4) If your digis are UIDIGI-ROMS, activate preemptive digipeating to eliminte all DUPES while continuing to support RELAY if desired. Though this just fosters the continued use of an obsolete system.

5) Remove RELAY, WIDE, TRACE, SS and TRACEn-N in all digis.

Done

de WB4APR, Bob

Without the digi's being upgraded to support the new n-N Paradigm, this will not work. The digi's must be upgraded first. The big digi's in the Knoxville area do not support WIDEn-N at all.

Now, about he WX packet network...can you elaborate on that? I have a WX Station that I run on APRS (and there are several others in the area) are you talking about some alternative to that?

Looking at this, it looks like we do not have a path to get packets from
Knoxville to KS4NG-7.

1715. WA4KJH-7 Digi upgrade

Yahoo group: EastTNAPRS
Date: 2006-04-30 17:25:18 UTC
From: Travis J. Maclay
Topic: 1715 Message: 1715

Group,

I know John Moyers hangs out on here, but I do not have his email address anymore for some reason. I know that many of us at one time or another have discussed the reasons on why the WA4KJH-7 digi has not been upgraded to date. I know that John has good reasons also for waiting. I am wondering at the same time, however, what those reasons were again?

I know that between about 6-7 of us on this list, we could upgrade just about anything up there. Seems last time I heard, it was just waiting until winter was over to handle the hike up there. I, for one, will donate the TNC if needed. We continually talk on here about not being able to do what we need to do properly and the entire region revolves around one TNC as it seems to me. Between all of the balloon chasers who hike through woods and those with gear, I would think we could do just about anything needed to accomplish the changeover if any of this is really the reason.

If this is not the reason, could we find another solution to the real problem, whatever that is. I guess I do not have a good grasp of what the holdup is. Seems if we have manpower to do the work and the equipment to put in it's place, should be just a matter of picking a free day on the calendar.

I'm curious if we can't find a good solution in the coming weeks. Another wide area digi possibly?

This is all sent in an effort to create a better APRS system in East TN, not to ruffle any feathers.

Thanks!
Travis Maclay

From: Ed Dial
Topic: 1715 Message: 1716

Well, one solution is to install a new wide digi. Has anyone approached Tim Berry to see if they can install one at Greentop? They may require installation of bandpass cavities in order to install a high-band system at that site (high density), but I think one would want to do that anyway.

You've probably seen me mobile in your general area.

I've been talking with Ken (KB0ZTX) and trying to get him to jump into APRS.

I also hear that the Olive Branch club will be having an APRS presentation at their next meeting by one of the guys from Jackson, TN.

With the repeater sites that you guys have in N MS, it should be pretty easy to get up a couple of high level digi's to cover the area well. With my D7, I notice that coverage drops shortly south of Olive Branch as I head toward Holly Springs.

KPC-3+ is available. ROM is 8.2, almost positive, will double check tomorrow. Will purchase 8.3 ROM if needed, I'll defer to someone else to answer.

If no offers to provide an antenna, I'm game for pitching in some $ to buy one.

What is the location, BTW?

Subject: [EastTNAPRS] New digi site and radio offered... we have a great offer.

OK, guys here it is, the offer has been made....see below.

I spoke to him about this and here is the system he has to offer us to use. All we need to provide is a new TNC and a new omni directional antenna. The reason I am saying new is it would be a major pain to put something up and it fail. But I know Travis's TNC is in great shape... aka new. Does anyone have a omni directional antenna they will donate to the cause? Or do we want to chip in and purchase a new one to put up? I am good either way.

Just a bit of trivia this site will / has Internet capabilities, just a passing thought of making a perminate "I" gate station and or a transmit point for the weather data WA4RYW is kind enough to send out for us. (BTW, I am not trying to remove Ed) if we wanted to sometime in the future once we get the new digi working for us.

Ok, the gantlet has been laid down, do we have any takers to pick it up and help...I am in anyone else?

73,

I have a radio that can be used.
It is a Motorola Syntor 110watt mobile radio with RX preamp and multi-cavity pre-selector.
It would be wise to use at 50watts output for 24hr operation.
The only thing that I need is a omni antenna and TNC. The heliax is already on the tower and the site has a power supply.
Ground Elevation is 3058 AMSL + 70ft on tower.

Hope this helps.

Topic: 1724 Message: 1724

I certainly would be willing to contribute some $ to a new digipeater antenna. I am going to check with Joe Riner, WD4DES who maintains the 147.18 machine and see if he has any commercial grade antennas we could buy/use.

According to WB4APR's web site:
http://eng.usna.navy.mil/~bruninga/aprs/kpc3+82WIDEn.txt
it depends on which version of the 8.2 rom you have.
Version KPC3-3F427265-8.2 or later should work fine with the new n-N paradigm; earlier versions should be updated to 8.3 if that's an option.

The plan is to set this digi up under the new WIDEn-N paradigm, right? This configuration would cause no duplicates with WA4KJH-7, so that's a good thing. If it has good coverage (which that location should), then we should all be able to make the transition to the new WIDEn-N paths (WIDE1-1,WIDE2-1 for mobiles).

I do not have an antenna that we could use, but I'm willing to kick in a bit for a new antenna...

From: Travis J. Maclay
Topic: 1719 Message: 1726

Well, so far I've seen 4 people willing to kick in some $ for an antenna. I'm sure there are more who will, but the offer's only been on the table now for about 12 hours. So, the big question needs to be - who can choose the antenna we need & price it? That will be helpful so that we know what needs to be purchased and how much we'll need.

I will check in just a while on the ROM. If it needs upgrading, I will move on that today.

Moe, did Scott give us a timeline of when we could begin using the new location & equipment?

And for the record, unless anyone objects and can convince the group, we do plan to setup the TNC "to the letter" according to Bob's recommendations for the new WIDEn-N paradigm. Most TNC settings will be shared for collaborative effort in setup. Please feel free to make suggestions if you have them.

Thanks!
Travis

1727. RE: [EastTNAPRS] New digi site and radio offered... we have a great offer.

Yahoo group: EastTNAPRS
Date: 2006-05-02 14:44:35 UTC
From: David Hoffman
Topic: 1719 Message: 1727

May I recommend either a Comet GP-9 or a Diamond X500?? Both of these are dual band antennas and go for around $200 new.
GP-9NC
VHF/UHF Dual Band Antenna
1.5:1 or less SWR:? 153-157/460-470MHz
Gain:? 8.5/11.9dBi
Max power:? 200 watts
Length:? 16ft 6inches
Weight: 3 lb 8 oz
Connector:? N-female
Construction:? Three piece white fiberglass
Max wind speed:? 92MPH
X500HNA Ruggedized Base/Repeater Antenna
Specifications:
Band:
2m/70cm
Gain (dB):
8.3/11.7
Max Power Rating:
200 watts
Wind Rating:
90 MPH (no ice)
Height (feet):
17.8
Connector:
Type-N
David Hoffman - KE4FGW

1728. Re: New digi site and radio offered... we have a great offer.

Yahoo group: EastTNAPRS
Date: 2006-05-02 15:03:23 UTC
From: kphillip162
Topic: 1719 Message: 1728

I would be willing to kick in a little to help on the antenna if it means we could get moved over to the new paradigm. Who is organizing the $$ part?

1729. Re: [EastTNAPRS] Re: New digi site and radio offered... we have a great offer.

Yahoo group: EastTNAPRS
Date: 2006-05-02 15:22:00 UTC
From: David Hoffman
Topic: 1719 Message: 1729

If we plan on buying this antenna locally and have it very soon, we can do that.? I offered to buy and carry back the?antenna from the Dayton Hamvention in a couple of weeks, whatever the consensus of the group decides to do.? I could also offer everyone the use of my PayPal account to make the donations to, that they feel would help the cause.? Timing sounds right because this digi won't be ready in 2 weeks to go to the repeater site.

1731. Fwd: APRS path in Western PA....

Yahoo group: EastTNAPRS
Date: 2006-05-02 18:48:12 UTC
From: William McKeehan
Topic: 1731 Message: 1731

Regarding the discussion earlier of where the new n-N paradigm is in place, it looks like Western PA has not upgraded.

---------- Original Message ----------
Subject: [aprssig] APRS path in Western PA....
From: "Robert Bruninga" <bruninga@...>
Date: Tue, May 2, 2006 2:22 pm
To: aprssig@...

>...trip to Cincinnati and back ... running WIDE1-1, WIDE2-2. ..
> FINDU could only see hits close to the philly area to just
>east of Lancaster, PA then nothing until... Cincinnati.
>it appears that digi's east of Lancaster , along the PA
>turnpike, along I 70 through W. VA and Eastern Ohio
>are NOT up with the new paradigm WIDEn-n.

Yes, a big problem area. In western PA it is impossible
to figure out what's out there because so few are using
the New-N paradigm recommendations... Thus, one cannot
even tell what they are! And everyone from the
midatlantic states has to go through there on the way
to dayton!

KB8CVP-7, no type, old-N, no PHG, no user info
N3LZX-9, no type, no overlay, no userinfo (Xdigi)
W3ND-2, Harrisonburg, old-N, no type, no user info

Only ONE that I can find in all of western PA includes
the simple New-N fundamentals:
1) An overlay "S" showing it has been upgraded
2) PHG info so users can tell the big digis from the useless ones
3) User info of the receommended paths (ie,"W3,WPAn")
4) Using the APNxxx type indicator to show type of TNC

Without that info, it is impossible to plan your trip.
Bob, Wb4APR

1732. RE: [EastTNAPRS] New digi site and radio offered... we have a great offer.

Yahoo group: EastTNAPRS
Date: 2006-05-02 20:47:01 UTC
From: Ed Dial
Topic: 1719 Message: 1732

I might suggest that you guys look into a commercial grade antenna from Maxrad or one of their direct competitors. The conditions on Greentop aren't very friendly to "ham grade" hardware.

From: EastTNAPRS@yahoogroups.com [mailto:EastTNAPRS@yahoogroups.com] On Behalf Of David Hoffman

To: EastTNAPRS@yahoogroups.com
Subject: RE: [EastTNAPRS] New digi site and radio offered... we have a great offer.

May I recommend either a Comet GP-9 or a Diamond X500? Both of these are dual band antennas and go for around $200 new.

GP-9NC

VHF/UHF Dual Band Antenna
1.5:1 or less SWR: 153-157/460-470MHz
Gain: 8.5/11.9dBi
Max power: 200 watts
Length: 16ft 6inches
Weight: 3 lb 8 oz
Connector: N-female
Construction: Three piece white fiberglass
Max wind speed: 92MPH

X500HNA Ruggedized Base/Repeater Antenna

Specifications:

Band:

2m/70cm

Gain (dB):

8.3/11.7

Max Power Rating:

200 watts

Wind Rating:

90 MPH (no ice)

Height (feet):

17.8

Connector:

Type-N

David Hoffman - KE4FGW

1733. New site antenna

Yahoo group: EastTNAPRS
Date: 2006-05-02 20:57:35 UTC
From: Christopher A. George
Topic: 1733 Message: 1733

Hello Moe and everybody else too,

I'm headed up to Hamvention on the 18th and will return on the 22nd of May. Do you all want me to shop for the need items for the the new Digi site ie: antenna and associated hardware? I have now problem with this and have the extra space in the trunk of the Mercedes to bring back whatever we need.

Chris KU4LV

P.S. To Moe:

If we can come up with the needed equipment, I'd be glad to put up a fill in Digi at my QTH.

1734. RE: [EastTNAPRS] New digi site and radio offered... we have a great offer.

Yahoo group: EastTNAPRS
Date: 2006-05-02 21:04:06 UTC
From: Ed Dial
Topic: 1719 Message: 1734

One of the best would be something from the Decibel/Andrews line. Rugged commercial grade antennas that will withstand severe conditions.

1735. New Digi TNC

Yahoo group: EastTNAPRS
Date: 2006-05-02 22:37:17 UTC
From: Travis J. Maclay
Topic: 1735 Message: 1735

Just checked today. It is a KPC-3+ ver 8.3 (not 8.2x as originally thought).

Full version for anyone interested is KPC3P-34F68191-8.3

73,
Travis

From: Travis J. Maclay
Topic: 1719 Message: 1737

I'm still curious how much we're trying to raise. Can someone on the group give a real world price for a commercial grade antenna. I heard $200 thrown out this morning, but seems that David was referring to amateur radio and commercial radio quality antennas.

Once I know this, I'll make my contribution to David Hoffman via PayPal. I think it wise that it all go through one person, so let's all decide David and that way if we pick it up at Dayton, he'll be there. If we order, he'll have the funds. If some want to use PayPal (like me), they can do so easily. Others can send money to his address. Dave will just need to provide a mailing address for that.

Thanks guys!

Travis

Subject: Re: [EastTNAPRS] New digi site and radio offered... we have a great offer.

HI guys,

I have to agree with Ed on this one, I think a commerical grade antenna would be better to use on on the mountain top verses our ham grade stuff. But it's up to the group on what we want to buy.... but with high straight line winds, snow and ice I am not too sure one of these would make it too long.

As far as who is collecting the funds at the moment I have no problem telling anyone to send money to David..... But if you don't have a paypal account you can send it to me. I will post amounts received up here for all to see, less names of course and send the sender a private email acknowledging the receipt of the money. I am sure David will be willing to do the same on the paypal money he receives. Anyone have a problem with this format?

You can either send me money here:

Monus Brewer, Jr N4CQW
PO Box 1232
Clinton, TN 37717

Or contact me directly and I can meet you face to face.

As far as a time frame goes... it's up to Scott really, once we get the stuff in hand then we can go from there. But I think some testing will be required before we go head long into using it.....

So I guess let the find rasing begin.....

73, Moe N4CQW

1739. Re: New digi site and radio offered... we have a great offer.

Yahoo group: EastTNAPRS
Date: 2006-05-03 04:04:56 UTC
From: Scott
Topic: 1719 Message: 1739

RE: COMMERCIAL GRADE ANTENNA PRICES

For a fiberglass enclosed dipole type antenna similar to the SuperStationmasters:

(Telwave)
148-174 MHz 2.5 dBd 60" 16 lb $633.00
144-151 MHz 6 dBd 256" 55 lb $968.00

Exposed dipole array types:

(Telwave)
138-174 MHz, 1 bay, 1 to 2.6 dBd, 36", 8 lb, $304.00
138-174 MHz, 2 bay, 3 to 6 dBd, 89", 21 lb, $617.00
138-174 MHz, 4 bay, 6 to 9 dBd, 195", 34 lb, $1,055.00
138-174 MHz, 8 bay, 7 to 12 dBd, 480", 68 lb, $2,109.00

Hope that helps.

Hardline is a whole nother matter...which ain't cheap.

Scott NA4IT

RE: Commercial Antennas Part 2

Here is another idea:

If you can find a good used Station Master type fiberglass antenna that was on say 150MHz or so, they can be retuned using a "dirty" tuning concept. A little work, maybe a new coat of resin, and it might turn out cheap and functional.

Where to find one? A lot are being taken down by police & fire departments to "upgrade" to the wonderful, always on, never down, 800 MHz systems. Talk right, one might get donated to you...

See
http://www.repeater-builder.com/antenna/retuning-a-stationmaster.html
for tuning info.

Another idea on Hardline...

There are some good articles on the net how to take some end reel runs of cable TV hardline and use some 1/4 wave coax matching stubs and be able to use it as a very low loss hardline...cable TV companies sometimes will give a ham club an end run of say 100-150ft of hardline...

As the RedNeck on TV says..."GIT 'ER DONE".

From: Bob Thomas
Topic: 1710 Message: 1746

the network was two nodes and mrx. the programs we got were called "RCM" (radar coded messages). the WX service was supposed to send us storm images and the RCM program would decode the radar images. they never sent us anything, so it died. the RCM program can still be found on TAPR's website (tapr.org). this was in the early days of digital images, i guess. i can also contribute to an antenna.. someone let me know who and where.

> abuse and packet flooding by ignorant 7-7's and so fourth.
>

Part of the new n-N is to trap abusive paths like WIDE7-7.

The other part is address the fact that KPC3 TNCs (used in a very large percentage of all U.S. digipeaters) don't do dupe suppression on "RELAY" or plain "WIDE" paths, but do on any kind of n-N path.

> Now I have seen all this chatter about 1-1 and 1-2 and how digi's dont
understand it, my question is simply "why?"
>

The WIDE1-1 path is a replacement for the now-obsolute "RELAY" (which KPC3s won't dupe supress) for home low-level fill-in digis.

> For years now I have simply used WIDE2-2 on all my paths, 3 or 4 years ago I
> went across country with the same path and it worked just fine with the
exception of the "dead" areas at the time.
>

By doing that you are depending solely on high-level wide-coverage "true WIDEn-Ns" only, and are bypassing the possible help from low-level home fill-in digis. In the west where WIDEn-N digis are *REALLY* wide on mountains thousands of feet above the user, this works well.

In the flat lands of the midwest and east coast where "true WIDEn-Ns" are typically only a few hundred feet above the user, the assistance of home stations via WIDE1-1 can make a major difference.

WIDE1-1 is compatible with either: a home station as the first hop, --or-- a true high-level WIDEn-N as the first hop. [The home station is typically

too stupid to properly decrement WIDE2-2 properly to WIDE2-1. Instead it would mark it as used, preventing any further digi hops.]

By using two WIDEn-N statements in series, a "dumb" home station can "eat" the first WIDE1-1 while leaving the following WIDE2-2 (or WIDE2-1) part for subsequent true WIDEn-N digis to process normally.

> So as I see it old or new setups should still accept the wide2-2 path, in our state that is the basic recommended path other then AZ2-2 but of course
> that's special to the state.
>

The whole history and rationale behind the new scheme is here on my website:

I talked to Joe Riner, WD4DES, this morning about the digipeater antenna. He said we could get one for about $200 which was the same kind he has been usi ng for years at his repeater site. For those of you who don't know Joe, he is a professional radio technician who also maintains several commercial and ham repeaters (eg. 147.18 on Oswald Dome). He also volunteered to do our climbing for us if we desire. I will pass along his e-mail when I get it as to his exact recommendations. I think he said something about a G-8 antenna, whatever that is. We might be able to get one at Dayton or he might have one already. Will have to see. I don't see paying thousands of dollars for an antenna if one for $200 will do the job. We will have to get what we can afford. Joe is the most knowledgable ham I know about such things, since he does that for a living. Stay tuned.

To: "UTARC Chat" <chat@...>

Hello All, Even-Steven is on schedule for launch this saturday! Check for
the latest details at http://www.utarc.org/wiki/index.php/Even_Steven

UX-8 will be launched Saturday May 13, 2006. Alternate date is
Sunday May 14, 2006.

Launch Time: 6:32 AM Local time

Primary Launch Site: Downtown Island Home Airport, Knoxville, TN

Alternate Launch Site: John C Tune Airport, Nashville, TN

Landing Site Prediction: Midwestern North Carolina

Primary Flight Path: Launch from Knoxville, climb to 70,000 ft, and hold
altitude for ~ 8 hours until past the Smoky mountains, and
descend into middle north carolina.

Alternate Flight Path: Launch from Nashville, climb to 70,000 ft, hold
altitude for ~ 8 hours and descend into the Tennessee Valley.

Recovery Team Leader: Tom Ogle

Launch Team Leader: Greg Williams

i would suggest a hustler g6-144 or a g7-144 base antenna. the 18 is using the g7-144 now, and seems to work and duplex very well. the g6 is about 9 feet

1761. New Digi Antenna - Fundraising Time

Yahoo group: EastTNAPRS
Date: 2006-05-10 13:39:47 UTC
From: Travis J. Maclay
Topic: 1759 Message: 1761

I vote that we go ahead and buy it ASAP and get it up before the offer goes away. I cannot speak to the fact of which is better, but I'll contribute $50 toward it. If we go w/ the more expensive one, we're 1/4 of the way there. If we go with the cheaper, well, you can do the math. David, I'll be sending this to you in the next day or so. Anyone that wants to contribute, even if it's $10, let's contact David Hoffman ASAP and try our best to raise this money so we can get this digi up while we have an offer for a spot on the tower, a radio & coax.

73,
Travis

1762. Digi Overlays

Yahoo group: EastTNAPRS
Date: 2006-05-10 13:42:16 UTC
From: William McKeehan
Topic: 1762 Message: 1762

I've been involved in a couple of discussions recently about digi overlays; i.e., what does the S, N or T (or whatever) on a green star indicate.

Well, Bob has a good web page that describes all of these:
http://eng.usna.navy.mil/~bruninga/aprs/digi-overlays.html

Well, someone needs to take the bull by the horns and make a decision. I do not have the knowledge to make this decision, nor the involvement with the person donating the tower space/radio.

If either of these antenna are what we decide to go with, I would be willing to contribute to the cause. Based on the comments in the earlier e-mail and the cost, I would suggest that we go with the lower cost (and shorter) antenna mentioned here. Just my 2 cents.

1766. Digipeater antenna

Yahoo group: EastTNAPRS
Date: 2006-05-10 18:24:01 UTC
From: WA4YYM@aol.com
Topic: 1766 Message: 1766

I will pledge $25 toward the new antenna, although I doubt that I will be in range of that digipeater. I will no doubt be using it at the lake or when traveling around Knoxville. I am reposting Joe Riner's (WD4DES) comments about which antenna to get. Joe is in the business so I value his opinion. If need be I can bring it back from Dayton. We are traveling in a van.

from Joe Riner:

"i would suggest a hustler g6-144 or a g7-144 base antenna. the 18 (machine) is using the g7-144 now, and seems to work and duplex very well. the g6 is about 9 feet tall and the g7, only 1 more db gain, is about 17 feet tall. both are available from hro in atl. i would side mount this antenna on the tower, with the use of an upper support arm, made out of pvc. the lower mount could be made out of 2" alum. angle,2 pcs., about 5 ' long. this length would let the antenna be about 4' out from the tower,(25G)."

1769. RE: [EastTNAPRS] Digipeater antenna

Yahoo group: EastTNAPRS
Date: 2006-05-10 19:31:49 UTC
From: Ed Dial
Topic: 1766 Message: 1769

Keep in mind that these wind ratings are for "no ice" conditions as well. Consider that at the Greentop site, rime ice can accumulate to a 2"+ buildup on fiberglass radomes and bare aluminum during winter weather events. Icing de-rates the spec considerably.

An antenna rated at 140 should be good, less with supports top and bottom.

-Ed

From: EastTNAPRS@yahoogroups.com [mailto:EastTNAPRS@yahoogroups.com] On Behalf Of David Ratledge
Sent: Wednesday, May 10, 2006 3:01 PM
To: EastTNAPRS@yahoogroups.com
Subject: Re: [EastTNAPRS] Digipeater antenna

I was just looking at the specs. on these two antennas (ustler g6-144 or a g7-144) and they both appear to be rated to withstand maximum winds of 100 mph. Hustler makes two others that might be worth comparing with for the final decision. They are:

Model HX6-14448 which has a maximum wind rating of 140 mph, a 6 db gain, and is 19.5 ft. tall. See http://www.wb0w.com/hustler/hd2mtr.htm
This is a high-dollar antenna though at HRO for $899.95 plus truck freight shipping rates.

Model HS3- 14448 which has a maximum wind rating of 160 mph, a 3 db gain, and is 10 ft. tall. See http://www.wb0w.com/hustler/spirit2mtr.htm
I didn't find this one at HRO but I'm sure the price is similar, if not worse.

I will pledge $50 towards a new antenna and the use of my Explorer to haul any part of the equipment and personnel to the site (and back of course). I won't climb on my own roof so I for sure won't be climbing a tower, but I can provide all the ground support anybody might need.

1770. UTARC UX-8 Launch, 5/13/2006, 12:00 am

Yahoo group: EastTNAPRS
Date: 2006-05-11 04:06:01 UTC
From: EastTNAPRS@yahoogroups.com
Topic: 1770 Message: 1770

Reminder from the Calendar of EastTNAPRS
http://groups.yahoo.com/group/EastTNAPRS/cal

UTARC UX-8 Launch
Saturday May 13, 2006
All Day
(This event does not repeat.)
(The next reminder for this event will be sent in 1 day, 23 hours, 51 minutes.)

Notes:
The University of Tennessee Amateur Radio Club will attempt to launch mission UX-8 on Saturday May 13, 2006. Launch location will be middle or west tennessee. Active altitude control will be tested: software will attempt to level off at 70,000 ft and perform several altitude deviations and returns to that altitude over the course of 2-3 hours. 2m APRS, 70cm voice, and 20M CW beacons will be aboard. More info is available at http://balloon.utarc.org /

Set up birthday reminders!

I agree that we should proceed quickly and get this done. I can chip in $25 and will go ahead and send a check to David Hoffman since I don't have a paypal account.

I agree that we should proceed quickly and get this done. I can chip
in $25 and will go ahead and send a check to David Hoffman since I
don't have a paypal account.

Reminder from the Calendar of EastTNAPRS
http://groups.yahoo.com/group/EastTNAPRS/cal

UTARC UX-8 Launch
Saturday May 13, 2006
All Day
(This event does not repeat.)

Notes:
The University of Tennessee Amateur Radio Club will attempt to launch mission UX-8 on Saturday May 13, 2006. Launch location will be middle or west tennessee. Active altitude control will be tested: software will attempt to level off at 70,000 ft and perform several altitude deviations and returns to that altitude over the course of 2-3 hours. 2m APRS, 70cm voice, and 20M CW beacons will be aboard. More info is available at http://balloon.utarc.org /

Set up birthday reminders!

1778. APRS on field day

Yahoo group: EastTNAPRS
Date: 2006-05-14 21:49:21 UTC
From: Stephen
Topic: 1778 Message: 1778

I am field day captain this year for the Johnson City Amateur Radio club, and I want to bring my gear out and operate APRS this year and get some people in the club interested. We will also be operating a packet station as well.

Does anyone have any experience or ideas they can share with this sort of setup? I suspect APRS will be used quite heavily during field day. I'll be using a laptop with UI-View 32, AGWPE for the TNC, a Rigblaster Pro and my Icom 2200H into a twin lead j-pole.

I'm looking for ideas from anyone that may have done this in a past field day, this will be my first one in years so I'm looking forward to it!

Thanks and 73 de N1VLV
Stephen

Topic: 1778 Message: 1779

APRS is a good demo mode for Field Day, and is a good tool for others to find their way to your Field Day site. However, a good look at the Field Day rules is needed to make sure you get what it is worth, and don't break the rules. Quoted from the ARRL 2006 Field Day Rules...

"Many new modes of communication are being introduced into the amateur's "bag of tricks." To encourage this experimentation, you may earn up to 300-bonus points by setting up demonstrations of a "non-traditional" mode of amateur communication. You may earn 100 points each for up to three different demonstration stations. This would include such things as APRS, ATV or one of the modes that is not covered by the three categories of QSOs ☐ CW, Digital and Phone. Be careful when you choose this mode. The digital category already includes such things as RTTY and PSK31, so they don't qualify for the bonus. Also you can't do the same demonstration three times for 300-points. It must be three separate demonstration modes. If you wish to claim packet for this special bonus credit, you must set-up a completely portable packet system, including a portable node. You may not use existing packet networks to qualify for packet credit under this bonus, and any contacts made do not count for QSO credit."

Important to remember is APRS is considered to be an "existing packet network". Also, "Packet may be claimed as a demonstration mode only if you set up a complete, portable packet network. This must include a temporary, portable node that is independent of the existing packet infrastructure in your area. Simply setting up a packet terminal and operating back to the established packet network in your area does not meet the requirement."

Remember also, some DX "Spotting" is done on APRS, and even though I did not find it in the rules, it seems I remember that "spotting" is not allowed for Field Day.

As pointed out, APRS is a great demonstration mode, and if you have the WX stuff running, might be a good tool to stay dry (or NOT get hit by lightning!)

Do it and enjoy!

To date, I have only received $100 from Travis and myself toward the purchase of some sort of antenna.? I have already left for the Dayton trip.? I'm off for the entire week.? I will try and monitor emails when I can.? There is a chance I won't see any emails until Thursday evening.? Any funds going towards the PayPal account can still be used in Dayton on Friday if you all want me to buy something while I'm there.? If not, that's OK.? We can still order and have one shipped when I return as well.? My PayPal account is ke4fgw@... if we've decided to go that route.? Thanks

From: William McKeehan
Topic: 1778 Message: 1784

It does not seem that the rules are very clear about APRS.

It states that a "complete portable packet system" would require a portable node, but we don't have that concept in APRS.

I think with APRS, if you have 2 stations communicating either direct or via a temporary digi (i.e., one that is setup just for the event), then that would count as a demonstration.

What do you have planned Scott?

Since APRS utilizes one frequency only, then it can be setup as a demonstration mode. We don't have a choice.

What I was making reference to as packet was actually pertaining to the DX spotting.

We had APRS up fo a little while last year. Hope to do it again.

The way I read it, the rules say for the demo to get 100 points you can not use existing infrastructure...after you've done that demo and secured the points, I propose using the existing infrastructure to show what can really be done.

Topic: 1778 Message: 1789

Remember, the basic idea behind Field Day is to practice emergency communications and show the public what we can do. APRS fits both of those bills. And, I suggest, since you will probably have a computer attached to the TNC or rig, have some screen shots available of APRS in use during Skywarn, a ballon chase, or maybe a search and rescue! Shot, crank up Power Point and do a slide show to run when you are not at the rig!

The power point I use to talk about APRS at club meetings has shots in it from the hurricanes in FLA, and local shots of screens around here, as well as a neat demo of how digipeating works.

1793. Digi Antenna

Yahoo group: EastTNAPRS
Date: 2006-05-20 01:40:42 UTC
From: David
Topic: 1793 Message: 1793

The Antenna fund is now up to $175. I have not heard anything about what type of antenna to purchase yet. Saturday will be my last day at the Dayton Hamvention. It looks like we will be ordering an antenna from somewhere else instead of picking one up here in Dayton. If there is a chance that I should pick one up while here at the Hamvention, somebody will have to call me on my cell phone and let me know. Thanks

1794. New Improved Digi Antenna

Yahoo group: EastTNAPRS
Date: 2006-05-20 02:32:10 UTC
From: Scott
Topic: 1794 Message: 1794

After speaking with Kevin, we decided to let you all in on the secret of our New Improved Digi Antenna. We will be using one of these for the No Pone digi. (Might work for the Tellico one also.)

Mind you, this only works at a site high on a mountian with tall trees.

It is very simple, and can be built with parts from Radio Shack and Home Depot or Lowes.

First, procure the following:

2- 19" lengths of copper wire, preferably insulated
2- ring terminals that will fit the gauge of wire you buy
2- butt splices
2- 10-16 penny nails
1- length of coax to run from antenna to transmitter (the bigger, the better, you need all the RF you can to get to the tree)

Assenbly instructions:
Strip aproximately 1/2" insulation from each end of both wires. Install a ring terminal on one end of each wire. Solder the connection as it will be in an extreme environment.

Prepare your coax by installing a suitable connector for the APRS transmitter on one end, and stirp the shield and center on the other end. Attach the center of the coax to the 1/2" bare end of one of the wires with a butt splice, and do the same with the sheild of the coax, using the other wire. Be sure to solder the connections, and insulate them.

Installation instructions:
First, find a tall tree near your site. This installation is totally safe, as you will not need to climb said tree. Take the wire that has the center of the coax connected to it and hold it upright with the ring ternimal at the top. Place against tree. Drive a nail through the ring ternimal into the tree at eye level. (CAUTION-Do not hit you self in the head with the hammer, remember, this is eye level. Eye protection is a must when using tools such as these...)

Now, grab the other wire, with the ring terminal at the bottom and stretch it down the tree. Drive another nail through the ring terminal into the tree. This should be about 38" below the other nail, +/- 1 inch. (See precationary note above...DO NOT hit yourself in the crotch with the hammer...pain will result...)

Attach your coax to your ARPS transmitter. You are done. You now have an excellent antenna for APRS use, as the attachment points of the two

wires will effectively radiate the entire tree.

Be sure to keep said tree well taken care of, Miracle Grow has been know to increase the dB gain of the tree, as it causes more radiators to grow (roots).

Don't worry about sending donations to me or Kevin, we can't sign the checks anymore...the people in the white coats took our Crayola crayons away...and we don't use Pay Buddy.

1795. Re: [EastTNAPRS] Digi Antenna

Yahoo group: EastTNAPRS
Date: 2006-05-20 05:05:31 UTC
From: Travis J. Maclay
Topic: 1793 Message: 1795

Based on David's email, I think it wise to go ahead and get it while he's there if he can. Not only will we save any shipping costs, but will have it here sooner while the tower space offer is still there.

In keeping w/ William's recommendation (why I agree with), I vote we go with the shorter of the two recommended antennas. Don, YYM, knows a guy who is personally using the recommended antenna which goes a long way when someone can give a personnel recommendation. I, like David, would prefer to see a Comet or Diamond over a Hustler. If there is a comparable Diamond or Comet @ hamfest, I vote we purchase it.

David, not sure who has given yet, but I do know of a couple of people who may not have made their contribution before you left. My vote is that we get the antenna while he's there.

Finally, here's copy from Don's previous email:
"i would suggest a hustler g6-144 or a g7-144 base antenna. the 18 (machine) is using the g7-144 now, and seems to work and duplex very well. the g6 is about 9 feet tall and the g7, only 1 more db gain, is about 17 feet tall. both are available from hro in atl. i would side mount this antenna on the tower, with the use of an upper support arm, made out of pvc. the lower mount could be made out of 2" alum. angle,2 pcs., about 5 ' long. this length would let the antenna be about 4' out from the tower,(25G)."

73,
Travis

1796. Tour de Blount press coverage

Yahoo group: EastTNAPRS
Date: 2006-05-21 16:16:40 UTC
From: William McKeehan
Topic: 1796 Message: 1796

The Blount County ECS group and APRS received some good press in the Maryville Daily Times today (Sports Section).

See the complete story here:
http://www.thedailytimes.com/sited/story/html/258164

During the event, several people stopped by the net control station (which was setup at Heritage High School) where Travis was running an APRS station. They were very impressed with how well we were able to tack our people using the system.

My personal favorite was the guy that was telling us how the Knoxville Marathon was able to track their front runner with a lead motorcycle running "something like this".

We had a total of 5 SAG vehicles on the course all running APRS (3 with D7's, two with D700's). Travis was using a Kantronics KPC 3+ and a Yaesu mobile radio setup with a laptop and a nice 19" flat monitor connected.

Initially, the net control station was not hearing very much, but after an antenna relocation, his map came to life and we were off and running.

Is anyone on this list in the Knoxville RACK club?

The Field Day coordinator asked tonight for someone to do an APRS demonstration for them at Field Day.

I would like to see one of their members do the demonstration if anyone is available.

Or is there anyone that would be interested in doing a demo for this group? It would be some good exposure for APRS.

Yahoo group: EastTNAPRS
Date: 2006-05-22 01:52:14 UTC
From: William McKeehan
Topic: 1778 Message: 1799

During the net tonight, I gave a summary of what I believe about the rules for field day and the 100 bonus points. I thought I would share them here for further discussion.

The rules are unclear.

Here's what I believe:

1. If you have a demonstration with 2 APRS stations and one temporary digi operating independant of the existing infrastructure (i.e., on a different frequency, not using existing digi's), you will certainly qualify for the bonus points.

2. If you have 2 APRS stations communicating without a digi, independant of the existing infrastructure, you may qualify for the bonus points.

3. If you have 1 APRS station communicating (i.e., tracking/watching/etc.) with other APRS stations using the existing infrastructure, you MAY qualify for the bonus points.

Given that, I plan to do option 1. I will follow that with option 3. I believe that option 3 will be a real demonstration of real APRS.

The language in the rules that makes things unclear to me is where it talks about NODES. NODES are something that you see in traditional packet networks...the concept does not exist in APRS.

Anyway, that my take on things...

So far, I know about 3 locations locally that will be doing an APRS demonstration on field day.

Athens
SMARC in Blount County
RACK in Knox County

Does anyone else have any demonstrations planned for field day?

I'd like to see demonstrations in Oak Ridge, someone in Morristown, and someone in Sevier county. Assuming the clubs would welcome the demonstration and there are operators available. I'm not limiting it to those 3, but those are 3 that I think are reasonably sized groups that would benefit from a demonstration.

I'm reposting this as it never did go through...

I've always believed that a Comet or a Diamond antenna was always a better antenna then a Hustler. Price alone for the same spec'ed antenna runs slightly more for the Comet or Diamond, then for a Hustler. But I will do what ever the group feels best. The whole point in the discussion was to see what our choices were. So everyone can vote on what they feel is best.

At any rate, I will also pledge $50. My PayPal account is <mailto:ke4fgw@...> ke4fgw@.... I can report on any funds received towards the antenna unless someone gives me specific directions to keep a certain donation private.

Tonight is a prime example of network overload.

Looks like the weather information is being relayed so many times there is almost no free time.

There are RED areas on my map that turn red only to go off 1 minute later.

This would be a good topic for discussion.

Right now, WA4RYW-1 is sending the WX objects for MRX, OHX, SPC and I think one more all using a 3 hop path of RELAY,WIDE2-2.

Personally I would like to see the path changed to just WA4KJH-7. That would result in 2 packets for each alert - one, the initial message from INet to RF, then the second via WA4KJH-7.

Is there anyone that does not hear WA4KJH-7?

If so, maybe changing the path to WA4KJH-7,WIDE2-1 would cover those stations. That would cause the packet to be digi'd multiple times. One from the IGate, second from WA4KJH-7, then by N4NEQ-3, KF4FZR-7, and all other digi's that hear WA4KJH-7.

Adding one hop to the path really increases the number of packets.

Topic: 1810 Message: 1812

You all saw tonight what we were seeing in McMinn Co about 2 months ago and everyone thought I was nuts and trying to be the packet police.

As easy as it is to set up an Igate, I too would recommend RYW send his packets to KJH only. Here in McMinn we don't even do anything other than a simple RF hop out, no digi's. And if the Chattanooga area needs to see the stuff, maybe we can talk someone down there into setting up an RFONLY hop Igate. I think that would keep the "air" much much clearer.

And no, we weren't double digiing tonight, because FZR-7 was seeing that RYW was already sending the packets out, and it was not doing it again. It was staying keyed for a minute at a time resending the WIDE 100-100 path that was hitting it. I probably need to check the power output of it to see if it cooked the finals!

Also, there seems to be a problem with the WXSVR (NOT MRX) that feeds the data. I noticed the WX objects and boxes are staying on up to 2-3 hours after they were supposed to expire.

Another thing the WX objects not going off on time may be someone's TNC's buffer may be filling up, and taking a long time to "dump" the digi'd TX packets. It would be someone's TNC that is turned on as a digi.

Mine does it on RX if the computer locks down, but not on TX because I don't need to run as a digi.

The path that you use for your position packets will have no affect on what you hear...

But if you do not hear any big digi in Anderson or Campbell counties, maybe that would be a good place for a high-level digi like KF4FZR did for Athens. They can hear and be heard by KJH sometimes, but not reliably, so they put in their own high-level digi and they use it as their primary...maybe the same needs to be done for Anderson/Campbell County.

1819. Wrong path...

Yahoo group: EastTNAPRS
Date: 2006-05-27 21:23:53 UTC
From: Scott
Topic: 1819 Message: 1819

Someone in the Knox area is using either "WIDE,WIDE1-1", "WIDE2-2,WIDE1-1", or "WA4KJH-7,WIDE1-1".

Hitting a lot of fill ins in the area.

Proper path is something like "WIDE1-1,WIDE2-2".

Just letting them know.

Kinda like sitting on a stuck mic...hihi.

I agree. It's bad practice to put WIDE1-1 anywhere in your path beyond the first position.

It seems that there are several people that do not understand how a path works and how their use of a bad path can cause other people problems.

Anyone have any educational material that you would suggest? I've tried to explain it on this list multiple times, but apparently my method does not make it clear to some people.

An Alternet method to stop the problem is to EXCLUDE them from being Digi'd thru your station.
I now have three stations in my list as of now. and one is WA4RYW.
This may not be the best way. but, ...

Roy and group,

I don't know about the network overload when wx bulletins come out but I have noticed that the last few times we've had a severe thunderstorm alert, my wx internet program gives me the alert 2 and 3 minutes BEFORE "MRX" sends it out over the air... Which seems kinda odd to me. Maybe someone up at MRX should be notified?

AFA2OS
AF MARS SHARES Station

1823. Proper APRS paths

Yahoo group: EastTNAPRS
Date: 2006-05-27 22:22:51 UTC
From: Scott
Topic: 1823 Message: 1823

Below you will find a plain english explanation of correct APRS paths for varying situations, all according to the new WIDEn-n paradiem.

BASE STATION, 25-50W OUTPUT
WIDE2-2, or WIDE1-1,WIDE2-1

MOBILE STATION, 25-50W OUTPUT
WIDE1-1,WIDE2-2, OR WIDE1-1,WIDE3-3

HT STATION, 5W OUTPUT
WIDE1-1,WIDE3-3

IGATE PATH
Igates need to be carefully considered as to if you need to even do them. If you are in an area where it is hard to "hear" an Igate, and there are several stations around you that are internet connected, then an Igate might be a good thing. Allow only those stations you know to be internet connected to go from the Internet to RF. Also, most Igate capable software has a way to setup a different path for the Igate than your beacon path. DO THIS! DO NOT USE YOUR BEACON PATH FOR AN IGATE. If you can't do a separate Igate path, get different software or don't do it! YOU WILL CAUSE PROBLEMS!

Proper path for Igate:
If only stations that can hear you without being digi'd need to hear the Igate, then go with RFONLY.
If the Igate needs to hit a local digi, then go with "DIGICALL,RFONLY" where DIGICALL is the call of the digi. WIDEn-n of any kind is simply not need for an Igate. Igates are meant to be "local" in nature!

FILL IN DIGIPEATERS
You need to carefully consider if you really need to be a digipeater. No home or mobile station ever needs to be more than a WIDE1-1 digipeater. Digi's set for a WIDEn-n other than WIDE1-1 add packet traffic that will cause problems.

Hope that helps. If you don't understand how to do these things, ASK FOR HELP before doing them, please. We want you to have a good functional APRS station. We also want the E TN area to be a good system for everyone to use. One packet path done wrong can clog the system for days until someone figures out who is doing it.

From: Travis J. Maclay
Topic: 1826 Message: 1826

Thought I'd share this with the group, as many on here are using the TM-D700. I have not experienced this yet, but wanted to forewarn those who unplug the remote head. I often unplug mine to remove it from the vehicle for security reasons. I guess now I will disconnect main power before doing so.

YMMV,
Travis N4TJM

The fuse that the KW tech is referring to is F902. It would be a good idea if every D-700 owner purchased a supply of MicroMini pigtail fuses.

I have stated this on this sig many times. Also many moons ago, I uploaded a .jpg file explaining the fuse position. Look in the "file" section for this.

Anyway, if you regularly unplug the control head, you will blow this fuse,,,eventually. It actually took me about 2 years to pop the fuse. Just blind luck. <grins>

Another note: There is another way to blow the 9.6v constant voltage supply, and many other parts. It would be a good idea to power down the

entire unit when plugging/unplugging the serial port cable, if you are using a computer.

Now, y'all do not have to listen to me. I know I will get "flamed" by folks who claim to "know it all", but I work on these radios and the advise issued by the KW technician is totally accurate.

Be safe, mates.

From: Scott
Topic: 1810 Message: 1827

Greg,

I don't think it is you, but you might want to change your digi settings to this:

At the top of the UI-VIEW digipeater setup screen, check only "Enable Digi", "UI Only" and "Alias Substitution", nothing else.

In the "Aliases" window, put in K4HSM,RELAY,WIDE1-1.

In the "Sub Alias" put K4HSM

In the "Dupe Secs" put 15

That should work well for you.

1828. Tellico Digi

Yahoo group: EastTNAPRS
Date: 2006-05-28 02:34:09 UTC
From: Scott
Topic: 1828 Message: 1828

Well, it is a little closer to reality. It is sitting on my desk programmed...

This TNC is an older Kantronics 9612 Version 5.2, so it isn't the wizz bang APRS digi, but...

I set it up like APRS Bob says to as a fill in, and it should do OK. Here are some particulars on what it does...

Callsign = K4EZK-3

BTEXT = 3519.20N108418.00W#..TELLICO WIDE1-1 DIGI

Beacons every 10 minutes

Unproto = APN952 (no hops on the ID / Btext)

Digi responds to K4EZK-3 or WIDE1-1 only.

It will show up once installed as a green star with a "1" in it.

1831. Someone's mic stuck on 144.390?

Yahoo group: EastTNAPRS
Date: 2006-05-28 05:55:58 UTC
From: Greg Williams
Topic: 1810 Message: 1831

I started noticing the list of stations on 2m go down, then listened on 144.390, and it is a dead carrier.

Can everyone check their stations. I'm on a beam and the "dead quiet" is to my northeast. I hear signal degradation to my south and to the WNW of the signal when I did a full 360 sweep.

Greg

1832. RE: [EastTNAPRS] Someone's mic stuck on 144.390?

Yahoo group: EastTNAPRS
Date: 2006-05-28 07:28:46 UTC
From: Ed Dial
Topic: 1810 Message: 1832

It looks like it's still there. I can't see it, but it's capturing KJH's RX. Only VERY close stations are digipeating via KJH, and I'm apparently not close enough. The only two local digis that are repeating me at the moment are N4NEQ-3, and KG4FZR-7.

BTW, KG4FZR, are you dupe checking? I'm seeing packets from several stations duplicating at least once. I.E.:

[<R:1148799507634]WA4RYW-1>APJI23,KG4FZR-7*,WIDE2-2:}WA4RYW-2>APX180,TCPIP,WA4RYW-1*:)IRLP-5700!3541.62NC08337.49W&/A=004100IRLP Node 5700 443.300MHz PL 100 < I should have seen WIDE2-1. 2-2 is my original path

[<R:1148799508916]WA4RYW-1>APJI23,KG4FZR-7*,WIDE2-1:}WA4RYW-2>APX180,TCPIP,WA4RYW-1*:)IRLP-5700!3541.62NC08337.49W&/A=004100IRLP Node 5700 443.300MHz PL 100 < I should have never seen this one

It looks like you're digipeating but not decrementing the path (old style paradigm), then duping the packet when another digi repeats the packet with a decremented path (incorrectly interpreting it as a new packet).

Here's another example of the same thing:

[<R:1148800312137]KD4QIA>APRX46,KG4FZR-7*,WIDE2-1:=3428.00N/08434.00W-000/000/Pickens Co. - Henderson Mtn. 1930' < In all likelihood, this one should have digipeated as WIDE2, or last hop unless you heard him directly, then it's correct

[<R:1148800313150]KD4QIA>APRX46,KG4FZR-7*,WIDE2:=3428.00N/08434.00W-000/000/Pickens Co. - Henderson Mtn. 1930' < This one should have never lived, as the digi you heard it from should have expired its TTL

In other words, I'm seeing two packets from you for every packet that has one hop or more left in the path.

Just an observation

Ciao - Ed

1834. KG4FZR-7 Dupe checking

Yahoo group: EastTNAPRS
Date: 2006-05-28 12:17:29 UTC
From: Scott
Topic: 1834 Message: 1834

Ed,

It's dup seconds are setup at 15 seconds.

Also, it does respond to the new stuff. Another digi down here is having the same problem you pointed out, and has had to exclude your station from it's digi, and I am afraid I am going to have to do the same. I don't know what else to do. If you have suggestions, please let me know. If you want to contact me off list, send to na4it at yahoo dot com.

Scott NA4IT

Ed,

Here is what we see in McMinn Co at my station from you...

WA4RYW-1>WA4KJH-7>KG4FZR-7*>WIDE2-1>APJI23 <UI>:
!3550.04NI08414.93W&PHG5330/W1-1 East Tennessee APRS IGate/Short Range
Fill DIGI, East Loudon Co, TN.

Suggestions?

KG4FZR-7 does respond to both old and new paradiems, and traps
anything above WIDE3-3. It is running UI-VIEW32 with the digi ini file
modified.

In looking at my log file for yesterday, I'm not seeing your station doing the wrong thing.

Are you changing your Unproto address (in the Station Setup dialog) when you turn on your digi?

In the Digipeater Setup, you will notice there's no mention of "path", only a list of Aliases.

Other than that, I agree with the setup recomendations that Scott suggested for your digi setup.

That will be a good one to have up.

I rode thru Tellico Plains on Friday, using a path of WIDE1-1,WIDE2-2 and had zero packets make it to the internet once I got below Indian Boundary. Coverage was poor from the time I crossed into Tennessee.

I'm also glad to hear that Charlie has a 700...one more station on the air!

If you guys figure out the solution to this problem, I'd appreciate hearing about it.

Are both of the digi's that are producing the duplicate packets UI-View32 stations?

I find this rather interesting.. I would say this was due to wild band conditions. KD4QIA was hitting KG4FZR-7 DIRECT....

Position of KD4QIA --- 16.5 miles northwest of Canton, GA ---

KD4QIA>APRX46,WIDE2-2,WIDE,qAo,KG4FZR-7::KD4DLT :got dat right/been up at jims workin on the car/warm{10}10

I think if you look at the message Kevin sent, you see that Ed's UNPROTO is actually "RELAY,WIDE2-2". If it hits KG4ZFR-7 direct, it sends it out as WIDE2-2, because KG4FZR-7 responds to both old and new paradiems. If it goes thru WA4KJH-7 first, the KG4FZR-7 does the Widen-n count down as it should.

So there are one of two ways to cure it:

(1) I make KG4FZR-7 respond to WIDEn-n only and can the RELAY and WIDE responses altogether.

(2) Ed changes his path to WIDE1-1,WIDE2-2, or just WIDE,WIDE, or WIDE2-2.

As I said, let me know. I wish everyone would get on the new WIDEn-n. It stops this stuff. In McMinn Co, every station's UNPROTO is the new WIDEn-n, and we don't have these problems. Guys, simply put, it works.

And for those who are wondering why KG4FZR-7 dose not send out WA4RYW-1 as "KG4FZR-7*,WIDE2-1"all the time ,
That can be explained easily. KG4FZR-7 dose not hear WA4KJH-7 100% of the time. and therefore If KJH-7 hears RYW-1
Direct, and FZR-7 also hears RYW-1 Direct. but FZR-7 dose not hear KJH-7.. No doup checking can be done.

From: Scott
Topic: 1828 Message: 1844

There was a question asked as to why Tellico will only do WIDE1-1.
That is because it is an older TNC which will only allow one alias in
the MYAlias slot. It could be WIDE1-1, Potatoes, Maters, Tellico, etc,
but only one. So I went with WIDE1-1 so that it would act as a true
fill in digi.

Projections show it has a good path to WA4KHJ-7.

From: Kevin R. Colvin
Topic: 1834 Message: 1845

IRT: (2) See bottom of page.

Changing the word RELAY to WIDE1-1 would not correct anything. In fact, I would make to worse.
Fill-In digi's are set up as RELAY and/or WIDE1-1 to assist "LOW POWER' and/or Stations needing a little help to gewt into a WIDE DIGI.
Thus changing RELAY to WIDE1-1 would still set off every Fill-In digi that hears WA4YRW-1. thus creating even more doups.

WA4RYW-1 has great coverage, and dose not need any help getting into a WIDE AREA DIGI.
Therefore I would sugest not using RELAY or WIDE1-1 in his path anywhere.

And a NOTE to FILL-IN DIGI's... FILL-IN DIGI's should only DIGI on RELAY and/or WIDE1-1.
If a Fill-in digi puts WIDE2-2 in their ALIAS list, they will digi all Stations using WIDE2-2 as there path.
Therefore creating unnessary doups.

And not to get anyone cornfused. The comment on fill-in digi's is refering to your Digi Set-up. Not your UNPROTO path.

There used to be a system where they manually entered the data for a warning in for radio broadcast, but it think the same computer does it all. There is just a delay in the sequence for what ever reason. Could be transition from computer server to wireline to radio?

I know the APRS system is the fastest when it all works right.

1849. Re: [EastTNAPRS] Re: KG4FZR-7 Dupe checking

Yahoo group: EastTNAPRS
Date: 2006-05-29 02:51:57 UTC
From: Kevin R. Colvin
Topic: 1834 Message: 1849

IRT: WA4RYW-1>APJI23,WA4KJH-7*,KG4FZR-7*,WIDE2-2
WA4RYW-1>APJI23,WA4KJH-7*,KG4FZR-7*,WIDE2-1

This could be that another digi that dose not have it's SUB-ALAIS turned on, or an older TNC that dose not do sub-alias, re-digi'd this after KG4FZR-7 did.

Here is another example : WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-1 Port=1 <UI Len=101>:
!3550.04NI08414.93W&PHG5330/W1-1 East Tennessee APRS IGate/Short Range Fill DIGI, East Loudon Co, TN.
We all know that WA4KJH-7 dose not do WIDEn-N digipeating (YET) but by looking at this packet path, you might assume that it did. when in reality the WIDE2-1 is another digi that dose not do SUB-ALIAS

Dose this answer your question?

From: Ed Dial
Topic: 1834 Message: 1850

No.

What you are seeing there is the first packet (and only packet from me) is sourced from RYW-1 (the asterisk indicates where you actually heard the packet from). The second packet was digipeated via N4CQW-1 digipeater, then followed by KG4FZR-7. The odd thing about that, the asterisk is after the path, not the callsign for KG4FZR-7, which I have no idea what that means. That is not consistent with a UI packet. The fourth packet is ALSO sourced from KG4FZR-7, which immediately sent the packet out again, but decremented the path by one hop, or WIDE2 (same as WIDE2-0, or TTL=0). Once again, it's odd that the path would have the "heard" indicator set. It's almost like FZR is sending WIDEn-n as a callsign. I'll try to strip some raw data and see what's going on.

This is normal activity, except for the duplicate packets generated by FZR. I'm suspecting a configuration bugaboo that is causing this anomaly.

1851. RE: [EastTNAPRS] Re: KG4FZR-7 Dupe checking

Yahoo group: EastTNAPRS
Date: 2006-05-29 02:54:08 UTC
From: Ed Dial
Topic: 1834 Message: 1851

You're dead right on this one. Adhering exclusively to the n-n paradigm
would most assuredly cure the problem.

From: EastTNAPRS@yahoogroups.com [mailto:EastTNAPRS@yahoogroups.com] On
Behalf Of Scott
Sent: Sunday, May 28, 2006 9:02 AM
To: EastTNAPRS@yahoogroups.com
Subject: [EastTNAPRS] Re: KG4FZR-7 Dupe checking

I think if you look at the message Kevin sent, you see that Ed's
UNPROTO is actually "RELAY,WIDE2-2". If it hits KG4ZFR-7 direct, it
sends it out as WIDE2-2, because KG4FZR-7 responds to both old and new
paradiems. If it goes thru WA4KJH-7 first, the KG4FZR-7 does the
Widen-n count down as it should.

So there are one of two ways to cure it:

(1) I make KG4FZR-7 respond to WIDEn-n only and can the RELAY and WIDE
responses altogether.

(2) Ed changes his path to WIDE1-1,WIDE2-2, or just WIDE,WIDE, or WIDE2-2.

As I said, let me know. I wish everyone would get on the new WIDEn-n.
It stops this stuff. In McMinn Co, every station's UNPROTO is the new
WIDEn-n, and we don't have these problems. Guys, simply put, it works.

Date: 2006-05-29 02:56:48 UTC
From: Ed Dial
Topic: 1834 Message: 1852

Good point

From: EastTNAPRS@yahoogroups.com [mailto:EastTNAPRS@yahoogroups.com] On Behalf Of Kevin R. Colvin
Sent: Sunday, May 28, 2006 10:52 PM
To: EastTNAPRS@yahoogroups.com
Subject: Re: [EastTNAPRS] Re: KG4FZR-7 Dupe checking

IRT: WA4RYW-1>APJI23,WA4KJH-7*,KG4FZR-7*,WIDE2-2

WA4RYW-1>APJI23,WA4KJH-7*,KG4FZR-7*,WIDE2-1

This could be that another digi that dose not have it's SUB-ALAIS turned on, or an older TNC that dose not do sub-alias, re-digi'd this after KG4FZR-7 did.

Here is another example : WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-1 Port=1 <UI Len=101>:
!3550.04NI08414.93W&PHG5330/W1-1 East Tennessee APRS IGate/Short Range Fill DIGI, East Loudon Co, TN.

We all know that WA4KJH-7 dose not do WIDEn-N digipeating (YET) but by looking at this packet path, you might assume that it did. when in reality the WIDE2-1 is another digi that dose not do SUB-ALIAS

Dose this answer your question?

Kevin / KF4YMC kf4ymc@...

Subject: RE: [EastTNAPRS] Re: KG4FZR-7 Dupe checking

I would agree. He would have to see me direct and digipeat on my "RELAY". My new regenerated path would then be WIDE2-2. The puzzle is why it re-sends the packet out again with a WIDE2-1? Does it actually generate these packets in direct succession, one right after the other?

-Ed

1853. RE: [EastTNAPRS] KG4FZR-7 Dupe checking

Yahoo group: EastTNAPRS
Date: 2006-05-29 03:00:12 UTC
From: Ed Dial
Topic: 1834 Message: 1853

Or I should say "apparent" inconsistency. As Kevin pointed out, there could be another digi misconfigured and involved.

From: EastTNAPRS@yahoogroups.com [mailto:EastTNAPRS@yahoogroups.com] On Behalf Of Ed Dial
Sent: Sunday, May 28, 2006 10:51 PM
To: EastTNAPRS@yahoogroups.com
Subject: RE: [EastTNAPRS] KG4FZR-7 Dupe checking

No.

What you are seeing there is the first packet (and only packet from me) is sourced from RYW-1 (the asterisk indicates where you actually heard the packet from). The second packet was digipeated via N4CQW-1 digipeater, then followed by KG4FZR-7. The odd thing about that, the asterisk is after the path, not the callsign for KG4FZR-7, which I have no idea what that means. That is not consistent with a UI packet. The fourth packet is ALSO sourced from KG4FZR-7, which immediately sent the packet out again, but decremented the path by one hop, or WIDE2 (same as WIDE2-0, or TTL=0). Once again, it's odd that the path would have the "heard" indicator set. It's almost like FZR is sending WIDEn-n as a callsign. I'll try to strip some raw data and see what's going on.

This is normal activity, except for the duplicate packets generated by FZR. I'm suspecting a configuration bugaboo that is causing this anomaly.

1856. RE: [EastTNAPRS] KG4FZR-7 Dupe checking

Yahoo group: EastTNAPRS
Date: 2006-05-29 03:30:33 UTC
From: Ed Dial
Topic: 1834 Message: 1856

Here's some other anomalies I'm seeing on the network:

[<R:1148872427739]WX4MRX>APU25N,WA4KJH-7*,WIDE2-2:>172015zWX service appreciates those monitoring.

[<R:1148872428653]WX4MRX>APU25N,WA4KJH-7*,WIDE2-1:>172015zWX service appreciates those monitoring.

[<R:1148872711886]KA4TAR>APS228,WA4KJH-7*,WIDE3-3:>290001z[228]KA4TAR Offical Emergency Station

[<R:1148872712806]KA4TAR>APS228,WA4KJH-7*,WIDE3-2:>290001z[228]KA4TAR Offical Emergency Station

[<R:1148872979994]KE4IQS>APU25N,WIDE2-2:@290320z3537.22N/08436.70W_338/000g000t068r000p000b10180h90/ {UIV32N}

[<R:1148872981033]KE4IQS>APU25N,WIDE2-1:@290320z3537.22N/08436.70W_338/000g000t068r000p000b10180h90/ {UIV32N}

And notice THIS packet sequence is completely normal. The difference, I wasn't heard or digipeated directly by FZR. I sent the packet out over the air, followed by the first digipeat via KJH, then the second digipeat via FZR HEARD via KJH! For some reason, N4NEQ didn't hear this packet (collision or something else).

[>R:1148873069050]WA4RYW-1>APJI23,RELAY,WIDE2-2:}WA4RYW-2>APX180,TCPIP,WA4RYW-1*:=3403.72N/08428.03WxXASTIR-Linux - EM74sb Tactical and Telemetr

From: Kevin R. Colvin
Topic: 1834 Message: 1857

I am going to make an asumption here. Which someone may have the correct answer for.
I speculate that the reason for the astrict being in the wrong position, is an UI-VIEW THING,
UI-View dose not always reflect the same log style as other programs do. But again this is just speculation,
and have worked with some other programs, I have noticed a difference.

Subject: RE: [EastTNAPRS] KG4FZR-7 Dupe checking

No.

What you are seeing there is the first packet (and only packet from me) is sourced from RYW-1 (the asterisk indicates where you actually heard the packet from). The second packet was digipeated via N4CQW-1 digipeater, then followed by KG4FZR-7. The odd thing about that, the asterisk is after the path, not the callsign for KG4FZR-7, which I have no idea what that means. That is not consistent with a UI packet. The fourth packet is ALSO sourced from KG4FZR-7, which immediately sent the packet out again, but decremented the path by one hop, or WIDE2 (same as WIDE2-0, or TTL=0). Once again, it's odd that the path would have the "heard" indicator set. It's almost like FZR is sending WIDEn-n as a callsign. I'll try to strip some raw data and see what's going on.

This is normal activity, except for the duplicate packets generated by FZR. I'm suspecting a configuration bugaboo that is causing this anomaly.

Can anyone hear KE4IQS directly? It looks like I'm hearing him directly without the aid of a digi on the surface, and he's decrementing his own path. Or else there's something else in there that's not appending a call.

I sent the packet out over the air, followed by the first digipeat via KJH, then the second digipeat via FZR HEARD via KJH! For some reason, N4NEQ didn't hear this packet (collision or something else).

1862. RE: [EastTNAPRS] KG4FZR-7 Dupe checking

Yahoo group: EastTNAPRS
Date: 2006-05-29 04:00:29 UTC
From: Ed Dial
Topic: 1834 Message: 1862

I'm in Knoxville this weekend. I'm going to set up a tracker in the morning and see if I can find a common source for the dups. There's just a handful of stations that are regularly duped. You may have a very good lead here.

1863. Re: KG4FZR-7 Dupe checking

Yahoo group: EastTNAPRS
Date: 2006-05-29 04:02:39 UTC
From: Scott
Topic: 1834 Message: 1863

Not going to do it tomorrow, but Tuesday, I am going to KG4FZR-7 and
it will become a WIDEn-n only digi. SImply no need for it to have the
old stuff in it, we all use the new stuff down here. I really don't
think it is causing the problems, but I am going to stay there a while
and make sure. I have watched it from here at the house, and I don't
see that on any other station.

1864. Re: [EastTNAPRS] KG4FZR-7 Dupe checking

Yahoo group: EastTNAPRS
Date: 2006-05-29 04:02:32 UTC
From: Kevin R. Colvin
Topic: 1834 Message: 1864

Thats no problem, I know Terry and also helped set up this station.

For whats its worth... I just saw my beacon go out. WIDE2-2, then digi'd by KG4FZR-7,WIDE2-1, then I saw WIDE2-1 (no sub)

I was under the impression that even the older TNC's would do at least the first Sub alias with there call, Could someone enlighten me .

Can you listen for his beacon and see if he's sending one or two packets?

This is a copy of comms with the operator of N4NEQ-3.

This may help.

Hi;

What Alias does the N4NEQ-3 digi support?

Our Emergency Communications group provides radio and APRS support for public
service events in our area. One of these events Start in Tellico Plains
and travels through part of North Carolina.

Thank you
Roy WA4BDS
Maryville TN

Subject: RE: N4NEQ-3

Gosh- it is hard to remember.
I'm pretty sure it is in the beacon text though if you can capture one.
There are 4. The ones I can remember are:

Relay,Wide,TN,Trace

It DOES do WIDE2-2 and any other WIDEN-N

WX4MRX is one of the "allowed" stations the goes from Internet to RF
through the Igate at KG4FZR-7, with one RFONLY hop (no digi's).

No problem here.

1869. RE: [EastTNAPRS] Re: KG4FZR-7 Dupe checking

Yahoo group: EastTNAPRS
Date: 2006-05-29 04:23:01 UTC
From: Ed Dial
Topic: 1834 Message: 1869

I really don't think it's your station. I think there's another one out there. I'm seeing dups from the Morristown area too, and I doubt that's caused by you. ;^)

From: EastTNAPRS@yahoogroups.com [mailto:EastTNAPRS@yahoogroups.com] On Behalf Of Scott
Sent: Monday, May 29, 2006 12:03 AM
To: EastTNAPRS@yahoogroups.com
Subject: [EastTNAPRS] Re: KG4FZR-7 Dupe checking

Not going to do it tomorrow, but Tuesday, I am going to KG4FZR-7 and it will become a WIDEn-n only digi. SImply no need for it to have the old stuff in it, we all use the new stuff down here. I really don't think it is causing the problems, but I am going to stay there a while and make sure. I have watched it from here at the house, and I don't see that on any other station.

1870. Re: [EastTNAPRS] Re: KG4FZR-7 Dupe checking

Yahoo group: EastTNAPRS
Date: 2006-05-29 04:23:35 UTC
From: Roy E. Pollard
Topic: 1834 Message: 1870

My Beacons go out as WA4KJH-7,WIDE.

Had to turn off digi as I was relaying one of the local Igates that was
using RELAY in his path.

Roy WA4BDS

1871. Re: KG4FZR-7 Dupe checking

Yahoo group: EastTNAPRS
Date: 2006-05-29 04:27:26 UTC
From: Scott
Topic: 1834 Message: 1871

Here is an example of what an Igated station coming thru KG4FZR-7
looks like.

WA4PNI-10>APU25N,TCPIP,KG4FZR-7* <UI>:
=3520.27N/08431.34W-...INTERNET ONLY...ETOWAH, TN {UIV32N}

Notice RFONLY, no digi path. KG4FZR-7 recieves it from the internet,
and sends WA4PNI-10 out as an RF beacon only with no digis or aliases
in the path. The UNPROTO path in out Igate says "RFONLY". Even if a
digi hears it, it won't do anything with it. And, it won't go back
into an Igate wither.

WX4MRX usually comes through the same way. I'd say out of 20 beacons
from MRX, we usually get 16 of them via the Igate.

Scott NA4IT

1872. RE: [EastTNAPRS] KG4FZR-7 Dupe checking

Yahoo group: EastTNAPRS
Date: 2006-05-29 04:27:51 UTC
From: Ed Dial
Topic: 1834 Message: 1872

I tried a quick experiment. I changed my path to WIDE2-2, and only one digi in range responded, which DID NOT append the call.

[>R:1148875471725]WA4RYW-1>APJI23,WIDE2-2:<IGATE,MSG_CNT=2343,LOC_CNT=42

[>I:1148875471725]WA4RYW-1>APJI23,TCPIP*:<IGATE,MSG_CNT=2343,LOC_CNT=42

IGate EM75vu

Does anyone with a fill-in digi have "WIDE2-1" as an alias?

Can anyone hear KE4IQS directly? It looks like Im hearing him directly
without the aid of a digi on the surface, and hes decrementing his own path.
Or else theres something else in there thats not appending a call.

Subject: RE: [EastTNAPRS] KG4FZR-7 Dupe checking

Heres some other anomalies Im seeing on the network:

[<R:1148872427739]WX4MRX>APU25N,WA4KJH-7*,WIDE2-2:>172015zWX service appreciates those monitoring.

[<R:1148872428653]WX4MRX>APU25N,WA4KJH-7*,WIDE2-1:>172015zWX service appreciates those monitoring.

[<R:1148872711886]KA4TAR>APS228,WA4KJH-7*,WIDE3-3:>290001z[228]KA4TAR Offical Emergency Station

[<R:1148872712806]KA4TAR>APS228,WA4KJH-7*,WIDE3-2:>290001z[228]KA4TAR Offical Emergency Station

[<R:1148872979994]KE4IQS>APU25N,WIDE2-2:@290320z3537.22N/08436.70W_338/000g000t068r000p000b10180h90/ {UIV32N}

[<R:1148872981033]KE4IQS>APU25N,WIDE2-1:@290320z3537.22N/08436.70W_338/000g000t068r000p000b10180h90/ {UIV32N}

And notice THIS packet sequence is completely normal. The difference, I wasnt heard or digipeated directly by FZR. I sent the packet out over the air, followed by the first digipeat via KJH, then the second digipeat via FZR HEARD via KJH! For some reason, N4NEQ didnt hear this packet (collision or something else).

[>R:1148873069050]WA4RYW-1>APJI23,RELAY,WIDE2-2:}WA4RYW-2>APX180,TCPIP,WA4RYW-1*:=3403.72N/08428.03WxXASTIR-Linux - EM74sb Tactical and Telemetr

Then according to Roy's UNPROTO path, KG4FZR-7 responds to it right also.

From: Roy E. Pollard
Topic: 1834 Message: 1875

You might try a path of WA4KJH-7,WIDE2-2

If WA4KJH-7 does not relay the weather messages most of Blount & Knox
counties will not hear them.
That way the low level digi's will not clutter up the network.

Roy WA4BDS

1881. RE: [EastTNAPRS] Re: KG4FZR-7 Dupe checking

Yahoo group: EastTNAPRS
Date: 2006-05-29 04:56:48 UTC
From: Roy E. Pollard
Topic: 1834 Message: 1881

I changed my beacon path to WA4KJH-7,WIDE2-1

and N4NEQ-3 relayed it.

Roy WA4BDS

1882. Re: [EastTNAPRS] Re: KG4FZR-7 Dupe checking

Yahoo group: EastTNAPRS
Date: 2006-05-29 04:57:03 UTC
From: Kevin R. Colvin
Topic: 1834 Message: 1882

I wonder if it could be to Conditions changing, or did someone notice and shut off their station?
Just a thought, which I hope the latter is WRONG.
Kevin/KF4YMC kf4ymc@...

Topic: 1834 Message: 1883

I bet you a dime to a donut someone has their home fill in digi with
everything they can checked in it and no call in the sub box.

From: Ed Dial
Topic: 1834 Message: 1885

I think you're on to something. Can you try it again?

From: EastTNAPRS@yahoogroups.com [mailto:EastTNAPRS@yahoogroups.com] On Behalf Of Roy E. Pollard
Sent: Monday, May 29, 2006 12:57 AM
To: EastTNAPRS@yahoogroups.com
Subject: RE: [EastTNAPRS] Re: KG4FZR-7 Dupe checking

I changed my beacon path to WA4KJH-7,WIDE2-1

and N4NEQ-3 relayed it.

1886. RE: [EastTNAPRS] Re: KG4FZR-7 Dupe checking

Yahoo group: EastTNAPRS
Date: 2006-05-29 05:02:21 UTC
From: Ed Dial
Topic: 1834 Message: 1886

I believe Roy found it. I can recreate it as well.

From: EastTNAPRS@yahoogroups.com [mailto:EastTNAPRS@yahoogroups.com] On Behalf Of Roy E. Pollard
Sent: Monday, May 29, 2006 12:57 AM
To: EastTNAPRS@yahoogroups.com
Subject: RE: [EastTNAPRS] Re: KG4FZR-7 Dupe checking

I changed my beacon path to WA4KJH-7,WIDE2-1

and N4NEQ-3 relayed it.

Roy WA4BDS

1887. Re: [EastTNAPRS] Re: KG4FZR-7 Dupe checking

Yahoo group: EastTNAPRS
Date: 2006-05-29 05:03:21 UTC
From: Roy E. Pollard
Topic: 1834 Message: 1887

That is just N4NEQ-3 at work He relayed KA4TAR

and my Beacon after WA4KJH-7 relayed it.

At 04:56 AM 5/29/2006 +0000, you wrote:

1888. Re: KG4FZR-7 Dupe checking

Yahoo group: EastTNAPRS
Date: 2006-05-29 05:03:08 UTC
From: Scott
Topic: 1834 Message: 1888

If you set a home fill in digi to anything greater than RELAY or
WIDE1-1, then it is going to respond to just about every station it
hears, which adds TONS of traffic to the network.

I never recommend anything other than RELAY,WIDE1-1 for a fill in.
That's national suggestions.

Scott NA4IT

1890. RE: [EastTNAPRS] Re: KG4FZR-7 Dupe checking

Yahoo group: EastTNAPRS
Date: 2006-05-29 05:08:33 UTC
From: Roy E. Pollard
Topic: 1834 Message: 1890

Shure I just sent a couple more beacons

A beacon path of WA4KJH-7,Wide2-1 is what I am going to stick with for now

WA4KJH-7 is the only Hi level digi left in the area that responds only to
the old stuff.

1891. Re: KG4FZR-7 Dupe checking

Yahoo group: EastTNAPRS
Date: 2006-05-29 05:12:40 UTC
From: Scott
Topic: 1834 Message: 1891

And here is what I see from Roy here in McMinn Co.

WA4BDS>WA4KJH-7>KG4FZR-7>WIDE2*>APU25N [UI]:
;SMARC FD *240106z3539.43N\08400.10W SMARC Field Day 2006 145.01Mhz

Looks right to me.

Scott NA4IT

1892. Re: [EastTNAPRS] Re: KG4FZR-7 Dupe checking

Yahoo group: EastTNAPRS
Date: 2006-05-29 05:14:54 UTC
From: Roy E. Pollard
Topic: 1834 Message: 1892

Moe;

KE4UHZ is not on my direct list at the present time.

Roy WA4BDS

At 01:09 AM 5/29/2006 -0400, you wrote:

1893. path question

Yahoo group: EastTNAPRS
Date: 2006-05-29 05:17:03 UTC
From: Kevin R. Colvin
Topic: 1893 Message: 1893

Now I have a question IRT The path of RYW-1,
Could it be possiable to change the word Relay out to something that will not set off home digi ?

1894. Re: KG4FZR-7 Dupe checking

Yahoo group: EastTNAPRS
Date: 2006-05-29 05:17:38 UTC
From: Scott
Topic: 1834 Message: 1894

If there in fact are fill in's in Knox area running with aliases of
WIDE2-1, that is probably where the problem is.

You may have to resort of using "directed paths" similar to what Roy
is doing.

Moe, for instance, you may have to do your UNPROTO path as
KF4UVT,WA4KJH-7,WIDE2-1, instead of UVT's digi being set to digi
WIDE2-1 or WIDE2-2. That still gets you where you want to go.

Any digi will usually digi on it's own call sign in a received path.

Scott NA4IT

1895. Re: path question

Yahoo group: EastTNAPRS
Date: 2006-05-29 05:19:46 UTC
From: Scott
Topic: 1893 Message: 1895

I'm inclined to agree with Kevin. I consistantly see WA4RYW-1 hit WA4KJH-7 on it's first hop out.

And "consistantly" is an awfully BIG word for 1:20AM...

Yes a path of WA4KJH-7,Wide2-2 will give the same coverage as now.

and not set off the low level digi's to clutter up the network.

From: Kevin R. Colvin
Topic: 1834 Message: 1897

If a home Fill-In digi puts WIDE2-2 in there ALAIS BOX, that only goes out 1 time
it dose not go out Call*,wide2-1.. it goes out CALL*

1898. RE: [EastTNAPRS] Re: KG4FZR-7 Dupe checking

Yahoo group: EastTNAPRS
Date: 2006-05-29 05:37:45 UTC
From: Ed Dial
Topic: 1834 Message: 1898

Well, I don't have a problem with that, but something that is being done to the packet is allowing KJH to see it as a new packet and allowing KJH to digi the packet again without regard to duplication checking. KJH should only digipeat any packet ONE time, irrespective of the hop count or path in general. Something's faking it out. Others as well, it's not just KJH.

If WA4KJH repeats a packet and there's hops left, then N4NEQ and any other WIDE that hears it should repeat it. But only one time. The big problem, I don't think the code that's in KJH understands what hops are. How about NEQ? Do you know what version ROMs are being used? I'm assuming it's a Kantronics 3 or 3+?

Well, I don't have a problem with that, but something that is being done to the packet is allowing KJH to see it as a new packet and allowing KJH to digi the packet again without regard to duplication checking.

KJH should only digipeat any packet ONE time, irrespective of the hop count or path in general. Something's faking it out. Others as well, it's not just KJH. Sorry, I dont follow what your are explaining

If WA4KJH repeats a packet and there's hops left, then N4NEQ and any other WIDE that hears it should repeat it. But only one time. The big problem, I don't think the code that's in KJH understands what hops are. How about NEQ? Do you know what version ROMs are being used? I'm assuming it's a Kantronics 3 or 3+?

John would be the one who could answer what type system he has up.

KJH dose not respond to WIDEn-N para. and the only way I understand that a digi will ping pong back and forth is using the old WIDE/RELAY style. If WIDE,WIDE2-2 were used, on the BEACON, I see no way KJH-7 could, or would redigi.. What am I not understanding ??

1903. RE: [EastTNAPRS] Re: KG4FZR-7 Dupe checking

Yahoo group: EastTNAPRS
Date: 2006-05-29 06:22:34 UTC
From: Ed Dial
Topic: 1834 Message: 1903

For some reason, this didn't make it the first time.

From: Ed Dial [mailto:diale@...]
Sent: Monday, May 29, 2006 2:08 AM
To: 'EastTNAPRS@yahoogroups.com'
Subject: RE: [EastTNAPRS] Re: KG4FZR-7 Dupe checking

It's not another digipeater here. We're looking at a bug. I set my path as "WA4KJH-7,WIDE2-2" and forced an update. I had a continuous data stream leaving the IGate (monitored with a portable), then a continuous stream repeated back by WA4KJH. The data received looked like this:

[>R:1148882048824]WA4RYW-1>APJI23,WA4KJH-7,WIDE2-2:<IGATE,MSG_CNT=2343,LOC_C
NT=46

[>I:1148882048825]WA4RYW-1>APJI23,TCPIP*:<IGATE,MSG_CNT=2343,LOC_CNT=46

[>R:1148882048825]WA4RYW-1>APJI23,WA4KJH-7,WIDE2-2:>East Tennessee APRS
IGate EM75vu

[>I:1148882048826]WA4RYW-1>APJI23,TCPIP*:>East Tennessee APRS IGate EM75vu

[<R:1148882053469]WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-2:!3550.04NI08414.93W&PHG5
330/W1-1 East Tennessee APRS IGate/Short Range Fill DIGI, East Loudon Co,
TN.

[<R:1148882053740]WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-2:<IGATE,MSG_CNT=2343,LOC_
CNT=46

[<R:1148882054056]WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-2:>East Tennessee APRS
IGate EM75vu

[<R:1148882055663]WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-1:!3550.04NI08414.93W&PHG5
330/W1-1 East Tennessee APRS IGate/Short Range Fill DIGI, East Loudon Co,
TN.

[<R:1148882055934]WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-1:<IGATE,MSG_CNT=2343,LOC_
CNT=46

[<R:1148882056251]WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-1:>East Tennessee APRS
IGate EM75vu

WA4KJH repeated back not only my packets with WIDE2-2 as my new path (normal - it stripped WA4KJH-7), but sent it out immediately again with a path of WIDE2-1. It never dropped carrier. It's sending duplicate packets.

Now, when I changed my path to WA4KJH-7,WIDE2-1, it did this:

[>R:1148882507784]WA4RYW-1>APJI23,WA4KJH-7,WIDE2-1:<IGATE,MSG_CNT=2343,LOC_C
NT=47

[>I:1148882507784]WA4RYW-1>APJI23,TCPIP*:<IGATE,MSG_CNT=2343,LOC_CNT=47

[>R:1148882507785]WA4RYW-1>APJI23,WA4KJH-7,WIDE2-1:>East Tennessee APRS
IGate EM75vu

[>I:1148882507786]WA4RYW-1>APJI23,TCPIP*:>East Tennessee APRS IGate EM75vu

[<R:1148882512433]WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-1:!3550.04NI08414.93W&PHG5
330/W1-1 East Tennessee APRS IGate/Short Range Fill DIGI, East Loudon Co,
TN.

[<R:1148882512704]WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-1:<IGATE,MSG_CNT=2343,LOC_
CNT=47

[<R:1148882513020]WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-1:>East Tennessee APRS
IGate EM75vu

[<R:1148882513799]WA4RYW-1>APJI23,WA4KJH-7*,WIDE2:<IGATE,MSG_CNT=2343,LOC_CN

Subject: RE: [EastTNAPRS] Re: KG4FZR-7 Dupe checking

It's not another digipeater here. We're looking at a bug. I set my path as "WA4KJH-7,WIDE2-2" and forced an update. I had a continuous data stream leaving the IGate (monitored with a portable), then a continuous stream repeated back by WA4KJH. The data received looked like this:

[>R:1148882048824]WA4RYW-1>APJI23,WA4KJH-7,WIDE2-2:<IGATE,MSG_CNT=2343,LOC_CNT=46

[>I:1148882048825]WA4RYW-1>APJI23,TCPIP*:<IGATE,MSG_CNT=2343,LOC_CNT=46

[>R:1148882048825]WA4RYW-1>APJI23,WA4KJH-7,WIDE2-2:>East Tennessee APRS IGate EM75vu

[>I:1148882048826]WA4RYW-1>APJI23,TCPIP*:>East Tennessee APRS IGate EM75vu

[<R:1148882053469]WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-2:!3550.04NI08414.93W&PHG5330/W1-1 East Tennessee APRS IGate/Short Range Fill DIGI, East Loudon Co, TN.

[<R:1148882053740]WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-2:<IGATE,MSG_CNT=2343,LOC_CNT=46

[<R:1148882054056]WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-2:>East Tennessee APRS IGate EM75vu

[<R:1148882055663]WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-1:!3550.04NI08414.93W&PHG5330/W1-1 East Tennessee APRS IGate/Short Range Fill DIGI, East Loudon Co, TN.

[<R:1148882055934]WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-1:<IGATE,MSG_CNT=2343,LOC_CNT=46

[<R:1148882056251]WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-1:>East Tennessee APRS IGate EM75vu

WA4KJH repeated back not only my packets with WIDE2-2 as my new path (normal - it stripped WA4KJH-7), but sent it out immediately again with a path of WIDE2-1. It never dropped carrier. It's sending duplicate packets.

Now, when I changed my path to WA4KJH-7,WIDE2-1, it did this:

[>R:1148882507784]WA4RYW-1>APJI23,WA4KJH-7,WIDE2-1:<IGATE,MSG_CNT=2343,LOC_CNT=47

[>I:1148882507784]WA4RYW-1>APJI23,TCPIP*:<IGATE,MSG_CNT=2343,LOC_CNT=47

[>R:1148882507785]WA4RYW-1>APJI23,WA4KJH-7,WIDE2-1:>East Tennessee APRS IGate EM75vu

[>I:1148882507786]WA4RYW-1>APJI23,TCPIP*:>East Tennessee APRS IGate EM75vu

[<R:1148882512433]WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-1:!3550.04NI08414.93W&PHG5330/W1-1 East Tennessee APRS IGate/Short Range Fill DIGI, East Loudon Co, TN.

[<R:1148882512704]WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-1:<IGATE,MSG_CNT=2343,LOC_CNT=47

[<R:1148882513020]WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-1:>East Tennessee APRS IGate EM75vu

[<R:1148882513799]WA4RYW-1>APJI23,WA4KJH-7*,WIDE2:<IGATE,MSG_CNT=2343,LOC_CNT=47

[<R:1148882514252]WA4RYW-1>APJI23,WA4KJH-7*,WIDE2:>East Tennessee APRS IGate EM75vu

Same thing, only decremented the duplicate set to zero.

That's software problems.

I'm going to bet that every station that is generating duplicate packets are directly pathing WA4KJH-7 instead of RELAY. There's clearly a bug in KJH's TNC.

To: 'EastTNAPRS@yahoogroups.com'
Subject: RE: [EastTNAPRS] Re: KG4FZR-7 Dupe checking

It's not another digipeater here. We're looking at a bug. I set my path as "WA4KJH-7,WIDE2-2" and forced an update. I had a continuous data stream leaving the IGate (monitored with a portable), then a continuous stream repeated back by WA4KJH. The data received looked like this:

[>R:1148882048824]WA4RYW-1>APJI23,WA4KJH-7,WIDE2-2:<IGATE,MSG_CNT=2343,LOC_CNT=46

[>I:1148882048825]WA4RYW-1>APJI23,TCPIP*:<IGATE,MSG_CNT=2343,LOC_CNT=46

[>R:1148882048825]WA4RYW-1>APJI23,WA4KJH-7,WIDE2-2:>East Tennessee APRS IGate EM75vu

[>I:1148882048826]WA4RYW-1>APJI23,TCPIP*:>East Tennessee APRS IGate EM75vu

[<R:1148882053469]WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-2:!3550.04NI08414.93W&PHG5330/W1-1 East Tennessee APRS IGate/Short Range Fill DIGI, East Loudon Co, TN.

[<R:1148882053740]WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-2:<IGATE,MSG_CNT=2343,LOC_CNT=46

[<R:1148882054056]WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-2:>East Tennessee APRS IGate EM75vu

[<R:1148882055663]WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-1:!3550.04NI08414.93W&PHG5330/W1-1 East Tennessee APRS IGate/Short Range Fill DIGI, East Loudon Co, TN.

[<R:1148882055934]WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-1:<IGATE,MSG_CNT=2343,LOC_CNT=46

[<R:1148882056251]WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-1:>East Tennessee APRS IGate EM75vu

WA4KJH repeated back not only my packets with WIDE2-2 as my new path (normal - it stripped WA4KJH-7), but sent it out immediately again with a path of WIDE2-1. It never dropped carrier. It's sending duplicate packets.

Now, when I changed my path to WA4KJH-7,WIDE2-1, it did this:

[>R:1148882507784]WA4RYW-1>APJI23,WA4KJH-7,WIDE2-1:<IGATE,MSG_CNT=2343,LOC_CNT=47

[>I:1148882507784]WA4RYW-1>APJI23,TCPIP*:<IGATE,MSG_CNT=2343,LOC_CNT=47

[>R:1148882507785]WA4RYW-1>APJI23,WA4KJH-7,WIDE2-1:>East Tennessee APRS IGate EM75vu

[>I:1148882507786]WA4RYW-1>APJI23,TCPIP*:>East Tennessee APRS IGate EM75vu

[<R:1148882512433]WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-1:!3550.04NI08414.93W&PHG5330/W1-1 East Tennessee APRS IGate/Short Range Fill DIGI, East Loudon Co, TN.

[<R:1148882512704]WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-1:<IGATE,MSG_CNT=2343,LOC_CNT=47

[<R:1148882513020]WA4RYW-1>APJI23,WA4KJH-7*,WIDE2-1:>East Tennessee APRS IGate EM75vu

[<R:1148882513799]WA4RYW-1>APJI23,WA4KJH-7*,WIDE2:<IGATE,MSG_CNT=2343,LOC_CNT=47

[<R:1148882514252]WA4RYW-1>APJI23,WA4KJH-7*,WIDE2:>East Tennessee APRS IGate EM75vu

Same thing, only decremented the duplicate set to zero.

That's software problems.

I'm going to bet that every station that is generating duplicate packets are directly pathing WA4KJH-7 instead of RELAY. There's clearly a bug in KJH's TNC.

Topic: 1893 Message: 1909

NEQ wasn't involved at all with my packets. KJH never even dropped the carrier, so it wouldn't be able to hear anyone else. The problem is, my path was WA4KJH-7,WIDE2-2 so KJH digipeated me and stripped my first path statement, or WA4KJH-7. The remaining path available should (and was) be WIDE2-2. Where the problem came in is during the very same transmission, KJH transmitted the packets AGAIN, only with the path decremented again, or WIDE2-1. It actually decremented my path THREE times, and sent my original packets out two times. BAD.

Now when I tried a path of WIDE,WIDE2-2 (bad choice) and RELAY,WIDE2-2 (obsolete but necessary), it worked OK. One common thread with any duplicate packets I've seen all evening involved a n-N paradigm in the path.

N4NEQ-3 apparently can only see me at times, and I noticed that it's not seeing me at the moment. I tried the path WA4KJH-7,WIDE and it worked OK, and N4NEQ-3 digipeated me via WA4KJH-7. That means that N4NEQ-3 is aliasing WIDE and RELAY, but not WIDEn-N.

Now that's just ONE problem that I have found and can reliably re-create it. There may be more, but everyone's gone. Hard to test.

Subject: Re: [EastTNAPRS] path question

Although, if NEQ-3 is not doing Sub at all on any Wn-N's,then that would be correct {WA4KJH-7,WIDE2-1}

From: Kevin R. Colvin
Topic: 1893 Message: 1913

No I don't Eat, Drink and Sleep APRS, but Close.
After sleeping on some thoughts.
I see only one reason I would get back a return like the folowing

2006-May-29 02:53:47 (local)
02:53:47R KF4YMC>ID,WA4KJH-7*,WIDE2-2 Port=1 <UI C Len=56>:
=3534.75N/08434.26W-PHG4470/kf4ymc@.../testing

2006-May-29 02:53:49 (local)
02:53:49R KF4YMC>ID,WA4KJH-7*,WIDE2 Port=1 <UI C Len=56>:
=3534.75N/08434.26W-PHG4470/kf4ymc@.../testing

A fill-in digi has WIDE2-2 in their Alias box.
That is the most likley answer.

So lets just look at this idea.
I beacon WA4KJH-7,WIDE2-2
KJH-7 Hears the beacon WA4KJH-7*,WIDE2-2
Now a non alias sub hears it WA4KJH-7,WIDE2-1*
then a fill in digi with WIDE2-2 in their Digi Alias box hears it WA4KJH-7*,WIDE2* Which this Fill-in digi also dose not have their Alias Sub turned on.

And with local conditions as good as they were last night, It could be possiable that I did hear Stations that I would normaly not hear.
I also did not see this happen any other time. [will re check machine # 2's log after my first cup of coffee]

Just another thought

Kevin/KF4YMC

"I'm going to bet that every station that is generating duplicate
packets are directly pathing WA4KJH-7 instead of RELAY."

OK if that is the case consider this...

When the thread we are working on first started, it was said the
KG4FZR-7 was duping the packets. BUT...it doesn't have WA4KJH-7
anywhere in it UNPROTO. It's UNPROTO is WIDE2-2.

1915. Another strange log event

Yahoo group: EastTNAPRS
Date: 2006-05-29 12:39:17 UTC
From: Kevin R. Colvin
Topic: 1915 Message: 1915

While I was sleeping, I had my machine {rf) sending out a beacon of
KF4YMC>ID,WA4KJH-7,WIDE2-1
but when checking that machines log I saw this KF4YMC>ID,KF4OWQ-2*,WIDE2*

KF4OWQ-2 Digipeater London, KY

Could this be that digi striped and replaced the path? This ocured around 08:08: 42 by that computors clock which is about 2 minutes slower than this putor.

Kevin/KF4YMC

1916. Re: [EastTNAPRS] path question

Yahoo group: EastTNAPRS
Date: 2006-05-29 13:00:32 UTC
From: Kevin R. Colvin
Topic: 1893 Message: 1916

oops , hadnt had my first cup of coffee and wast thinking clearly

So lets just look at this ideas.
I beacon WA4KJH-7,WIDE2-2
KJH-7 Hears the beacon WA4KJH-7*,WIDE2-2
Now a non alias sub hears it WA4KJH-7,WIDE2-1*
If a fill in digi with WIDE2-2 in their Digi Alias box hears it after KJH-7 hears it.
WA4KJH-7*,WIDE2* Which this Fill-in digi also dose not have their Alias Sub turned on.

I got my thinking crossed up..
----- Original Message -----

Subject: Re: [EastTNAPRS] path question

No I don't Eat, Drink and Sleep APRS, but Close.
After sleeping on some thoughts.
I see only one reason I would get back a return like the folowing

2006-May-29 02:53:47 (local)
02:53:47R KF4YMC>ID,WA4KJH-7*,WIDE2-2 Port=1 <UI C Len=56>:
=3534.75N/08434.26W-PHG4470/kf4ymc@.../testing

2006-May-29 02:53:49 (local)
02:53:49R KF4YMC>ID,WA4KJH-7*,WIDE2 Port=1 <UI C Len=56>:
=3534.75N/08434.26W-PHG4470/kf4ymc@.../testing

A fill-in digi has WIDE2-2 in their Alias box.
That is the most likley answer.

So lets just look at this idea.
I beacon WA4KJH-7,WIDE2-2
KJH-7 Hears the beacon WA4KJH-7*,WIDE2-2
Now a non alias sub hears it WA4KJH-7,WIDE2-1*
then a fill in digi with WIDE2-2 in their Digi Alias box hears it WA4KJH-7*,WIDE2* Which this Fill-in digi also dose not have their Alias Sub turned on.

And with local conditions as good as they were last night, It could be possiable that I did hear Stations that I would normaly not hear.
I also did not see this happen any other time. [will re check machine # 2's log after my first cup of coffee]

Just another thought

Kevin/KF4YMC

Subject: RE: [EastTNAPRS] path question

NEQ wasn't involved at all with my packets. KJH never even dropped the carrier, so it wouldn't be able to hear anyone else. The problem is, my path was WA4KJH-7,WIDE2-2 so KJH digipeated me and stripped my first path statement, or WA4KJH-7.

1919. UI-VIEW32

Yahoo group: EastTNAPRS
Date: 2006-05-29 13:29:36 UTC
From: Scott
Topic: 1834 Message: 1919

Christopher,

You can download and register UI-VIEW32 at
http://www.apritch.myby.co.uk/uiv32_uiview32.php.

The registration is free for a promise to donate to cancer research. I
think you will find it much easier to operate than WinAPRS.

1920. Another thought from YMC

Yahoo group: EastTNAPRS
Date: 2006-05-29 13:29:47 UTC
From: Kevin R. Colvin
Topic: 1920 Message: 1920

Although, I don't think this is relevent in this incident, but It is something to keep in mind.

I also have been thinking about how UI-View works as a DIGI.
If someone was to have UI-View set up as a full digi and has not modifiyed the Digi_Options in the UI-View 32.INI file.
UI-View would not append their call to the path, unless it was the First call in a Wn-N path. It would just discriminate the #-# only.
even if they have sub-alias checked.

I would suggest to anyone using UI-View or any other program, Be sure you understand the program and how it will react before just turning on the DIGI OPTION.

Some of the OLDER programs and newer ones may need a modification done to them to respond correctly in this ever changing world of APRS.

IF SOMEONE IS USING UI-VIEW32 AND GOING TO USE WIDE 2-1, OR WIDE2-2 IN THEIR FILL IN DIGI,

PLEASE DO ME A FAVOR,,, EXCLUDE ME FROM YOUR DIGI,

HERE'S HOW

GO TO : C:\Program Files\Peak Systems\UI-View32

IN THE UI-VIEW32 FOLDER YOU WILL SEE "UIVIEW32.INI" OPEN IT WITH SOMETHING LIKE NOTEPAD.
FIND THE [DIGI_OPTIONS]
AT THE BOTTOM, YOU WILL SEE EXCLUDED=""
PUT MY CALL KF4YMC IN BETWEEN THE "" PLEASE.
THIS WILL STOP YOUR FILL-IN DIGI FROM DIGIN' ME NO MATTER WHAT "-#" I USE AT THE END OF MY CALL

```
[DIGI_OPTIONS]
DIGI_ENABLED=TRUE
UI_ONLY=TRUE
ALIAS_SUBSTITUTION=TRUE
DUPE_SUPPESS_SECONDS=30
ALIAS=your_call,RELAY,WIDE1-1
UIFLOOD=TN
UITRACE=WIDE
WIDEN-N=FALSE
TRACEN-N=FALSE
SUBST_ALIAS=your_call
EXCLUDED="KF4YMC"
```

Yahoo group: EastTNAPRS
Date: 2006-05-29 15:35:53 UTC
From: Kevin R. Colvin
Topic: 1924 Message: 1927

to stop unnessassary doups when you had WIDE2-2 in your home fill-in, i saw you digi'n me, but I only went out N4CQW-1 and no further
but i requested two hops and got 1. and if I use WA4KJH-7, WIDE2-1, as I am doing right now. why do I need stations that hear me in Knoxville area re-send me out to stations that more than likey hear me anyway. And if 1 or 2 stations don't hear me, thats no great loss to me. If I need to contact them I can adjust my path . We complain about OVERLOADED SYTEM, but we overload it.
Now The use of fill in digi's is to assist those stations with weak signals that need help accessing a WIDE AREA DIGI. which I can normaly hit 2 or more if I desire. SO I dont need help getting into a WIDE AREA DIGI.

Therefore if I dont need help why not exclude me from those Fill-In digi's... That would help reduce traffic flow, wouldn't it?
And if I have to, I can switch ower to a beam to better access a station if nessessary. but I dont see that my station is that important that evreyone everywhere has to see me 100% of the time. And with the lay of the land, and constant changing conditions, my WIDE2-2 packet has made it to Nashville at times. . Si do I really need help?

Hope that answers you question on why I requested to be excluded from home Fill-In Digi's.

1928. Digi Antenna - re-visited

Yahoo group: EastTNAPRS
Date: 2006-05-29 16:25:38 UTC
From: Travis J. Maclay
Topic: 1928 Message: 1928

Okay group, let's not let the antenna decision be the thing that makes us lose our existing tower offer.

We've come together thus far and raised $225 according to David Hoffman's spreadsheet. Looks like a bit more is pledged and hopefully on the way.

According to the only recommendations we've received (Joe Riner's recommendation thru Don WA4YYM), our options are a Hustler G6-144B or a Hustler G7-144. David mentioned that his preference would be a Comet or a Diamond over a Hustler. What models have you used w/ good experience David? I'm open to any of them. If we've not had personal experience with the type antenna we're recommending, I'm a bit hesistant to go buy it based on manufacturer. I usually tend to sway toward manufacturers of my preference, but Joe Riner did say he had been using the Hustler w/ good experience. Again, I just want to move on it while we have an offer.

So, although Robert's Rules of Order are not in effect here, I would like to make a motion that we spend either $129 or $189 for the G6-144B or G7-144 respectively. David, if you have another option, please reply so we can decide.

Either way, can we open the voting officially via email? Go ahead and reply w/ your vote. Is it too daring to say let's open this vote for 2.5 days, to close Wednesday evening at 10:00? We can tally & then place the order from HRO. The sooner we do this, the better chance we have of securing a new paradigm digi at a nice location.

Thanks!
Travis

1929. New poll for EastTNAPRS

Yahoo group: EastTNAPRS
Date: 2006-05-29 16:34:31 UTC
From: EastTNAPRS@yahoogroups.com
Topic: 212 Message: 1929

Enter your vote today! A new poll has been created for the
EastTNAPRS group:

In light of the upcoming new paradigm digi antenna purchase, which antenna would you recommend we purchase? A personal recommendation has come from Joe Riner for either a Hustler G6-144B or a Hustler G7-144. Others have had good experience with a Comet or Diamond.

o Hustler G6-144B (6dBd - 9'9")
o Hustler G7-144 (7dBd - 15'4")
o Comet CA-ABC 22a (6.5dBi - 9'5")
o Comet CA-ABC 23 (7.8dBi - 13'4")
o Diamond CP22E (6.5dB - 9'0")
o Diamond F23A (7.8dB - 15'0")
o Other - please specify in email to group

To vote, please visit the following web page:
http://groups.yahoo.com/group/EastTNAPRS/surveys?id=1597678

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups
web site listed above.

Thanks!

1932. RE: REQUEST FROM YMC

Yahoo group: EastTNAPRS
Date: 2006-05-29 16:42:58 UTC
From: Kevin R. Colvin
Topic: 1924 Message: 1932

What does a station hitting WA4KJH-7 direct but has "WIDE1-1" behind WA4KJH-7 do to the system?

I can tell you what I see..

I see this "UN-NAMED Station hittime WA4KJH-7 direct, then KJH-7 beacons UN-NAMED station out like this

WA4KJH-7*,WIDE1-1

Now, Every Fill_In digi (that responds toWIDE1-1) that hears KJH-7, Will send it out.

Now thats just take my QTH for example. And I have my Fill-in digi on.

I will digi on the WIDE1-1
KE4IQS will also digi on that WIDE1-1
KG4FZR-7 will digi on WIDE1-1

Now Poor Ol (not OLD!) Roy/WA4BDS hears KJH-7 direct, hears my qth direct, hears IQS direct,hears FZR-7 direct..

WOW, Roy just got slammed and thats just from down in this area. Now he also has those stations in the area North of him that may also be sending out this WIDE1-1 packet. and WHAM! 5 or more stations digi'n the same station all at once, Collission just might be a good word here.
And if all the stations were to transmit just a few fractions on a second off, Roy might see this Station comming in on his terminal screen 7 or 8 times.. When he has already got the packet from KJH-7.

This would be the same if all Fill-In stations added WIDE2-2 to there Alias list. and Having Wide2-2 in the Alias list dose not mean you send it out and it gets re-digi'd, It goes out one time and thats it..

I hope this explains why I feel the way I do.. and Yes, some are using WIDE1-1 AFTER WA4KJH-7

Yahoo group: EastTNAPRS
Date: 2006-05-29 16:04:03 UTC
From: William McKeehan
Topic: 1810 Message: 1934

OK, I think you've lost your mind :-)

So you've either lost your mind or I totally do not understand what it is tyat you're talking about/saying should happen. So I think some explaination is in order.

1. Explain how you have your station setup (and don't use the word PATH, use the UI-View terms of UNPROTO and ALIASES to avoid any confusion).
2. Explain how you think Greg should be setup.
3. Explain what other digi's you think need to have their settings updated and how you think they should be setup.

Then, assume if everything is setup like you suggest.

4. Explain how you think a packet would travel to your station from, let's say, WX4MRX.
5. Explain how you think your packet would travel from your station to WX4MRX.

At that point, it should be very clear to everyone that you've lost your mind - I mean it should be very clear to everyone what you are saying :->

Moe,

Come on man. I'd really like you to not give up here, cause we're all learning a lot about this stuff. It's not that you have to defend your point, just further clarify it. You may be entirely correct, but I think some people in this conversation are using different terminology and are trying to explain different things. I think William is onto something here, but just indulge him. His picking is all in good fun.

I, for one, would love to learn what you are talking about, because I too have problems at times w/ KJH. I think the problem they are referring to is different than what you are describing. So...hop back in and tell us what you're experiencing. I'd love to hear your answers to William's questions.

Thanks man!
Travis

Subject: Re: [EastTNAPRS] Network Overload

Never mind just forget the whole thing it is pointless to try and explain what I see and what you see we have way different realities. Most of you are in shadow of the digi and I am not. I do not hear KJH direct so I need a extra hop to hear packets from everyone...

Moe

On 5/29/06, William McKeehan <yahoo-mail@...> wrote:

OK, I think you've lost your mind :-)

So you've either lost your mind or I totally do not understand what it is tyat
you're talking about/saying should happen. So I think some explaination is in
order.

1. Explain how you have your station setup (and don't use the word PATH, use
the UI-View terms of UNPROTO and ALIASES to avoid any confusion).
2. Explain how you think Greg should be setup.

3. Explain what other digi's you think need to have their settings updated and
how you think they should be setup.

Then, assume if everything is setup like you suggest.

4. Explain how you think a packet would travel to your station from, let's
say, WX4MRX.
5. Explain how you think your packet would travel from your station to WX4MRX.

At that point, it should be very clear to everyone that you've lost your mind
- I mean it should be very clear to everyone what you are saying :->

From: Travis J. Maclay
Topic: 1924 Message: 1940

I talked to K4AVG about 1:00 and explained all of this to him. He has changed his UNPROTO to WA4KJH-7,WIDE2-2.

Does this solve the particular situation you're talking about?

Travis

Subject: [EastTNAPRS] RE: REQUEST FROM YMC

What does a station hitting WA4KJH-7 direct but has "WIDE1-1" behind WA4KJH-7 do to the system?

I can tell you what I see..

I see this "UN-NAMED Station hittime WA4KJH-7 direct, then KJH-7 beacons UN-NAMED station out like this

WA4KJH-7*,WIDE1-1

Now, Every Fill_In digi (that responds toWIDE1-1) that hears KJH-7, Will send it out.

Now thats just take my QTH for example. And I have my Fill-in digi on.

I will digi on the WIDE1-1
KE4IQS will also digi on that WIDE1-1
KG4FZR-7 will digi on WIDE1-1

Now Poor Ol (not OLD!) Roy/WA4BDS hears KJH-7 direct, hears my qth direct, hears IQS direct,hears FZR-7 direct..

WOW, Roy just got slammed and thats just from down in this area. Now he also has those stations in the area North of him that may also be sending out this WIDE1-1 packet. and WHAM! 5 or more stations digi'n the same station all at once, Collission just might be a good word here. And if all the stations were to transmit just a few fractions on a second off, Roy might see this Station comming in on his terminal screen 7 or 8 times.. When he has already got the packet from KJH-7.

This would be the same if all Fill-In stations added WIDE2-2 to there Alias list. and Having Wide2-2 in the Alias list dose not mean you send it out and it gets re-digi'd, It goes out one time and thats it..

I hope this explains why I feel the way I do.. and Yes, some are using WIDE1-1 AFTER WA4KJH-7

1941. Re: Network Overload

Yahoo group: EastTNAPRS
Date: 2006-05-29 21:11:47 UTC
From: Scott
Topic: 1810 Message: 1941

So we get on the same page, let's look at some definitions:

APRS PACKET = a line of code that tells a receiving station the tranmitting station's callsign, location, identifying symbol, beacon address (destination), and other status text.

UNPROTO (or UNPROTO Address) = The "address" or destination you want your beacon to be sent to. A transmit parameter only.

ALIAS(es) = an alternate identity a digipeater will respond to. A receive paramenter that tells a digipeater how to respond to a received packet.

Common aliases:
CALLSIGN = the station call sign. A packet recieved with the digipeaters call sign in the packet will be digipeated.
RELAY = A received station asking for one hop to hit another digipeater or station. (old way of doing things)
WIDE1-1 = A received station asking for one hop to hit another digipeater or station. (new way of doing things)
WIDE = A station asking for one hop to hit another digipeater or station. (old way of doing things)
WIDEn-n = A station asking for "n" number of hops to another digipeater or station, and asking the digipeaters to "count down" the number of hops until zero. (new way of doing things)

ALIAS Substitution = the practice of substituting the digipeating station's call sign for an alternate identity, such as RELAY,WIDE,WIDEn-n.

Sub Alias = the digipeating station's call sign

From: Scott
Topic: 1924 Message: 1942

That has corrected his path, and he should now hit digipeaters the correct way. He did a good job! And thanks for contacting him. We saw the change almost the minute he did it.

MessageIRT the "UNNAME STATION" YES
Although this also can be is related to improber use of WIDEn-N's
ie: WIDE2-1 and/or WIDE2-2 in an ALIAS on fill-In digi's.

Kevin/ KF4YNC

Subject: RE: [EastTNAPRS] RE: REQUEST FROM YMC

I talked to K4AVG about 1:00 and explained all of this to him. He has changed his UNPROTO to WA4KJH-7,WIDE2-2.

Does this solve the particular situation you're talking about?

Don't give up yet!

Kevin sent me a private e-mail and may have clued me in a little about what it is that you're talking about.

*****
Let me ask this question. If KF4UVT were a full WIDEn-N digi, would this fix your situation?
*****

When the Oak Ridge Digi was discussed, I originally thought it was going to be a wide area digi...I think one is needed in that area; maybe over in Union county or further north in Campbell county.

Don't shutdown...it looks like the problem is not that you've lost your mind, but that I just don't understand your proposed solution. Please explain.

And on a related note, how well do you hit 147.195 compared to 146.85 at your new location? I wonder if the new digi will cover you where KJH does not now. If voice coverage is better on 147.195, it stands to reason that digi coverage may be better as well.

Moe,
If you think I am pickin on YOU. thats not so. If William said to put WIDE2-1 or 2-2 in fill-ins Alias box, I would go to wits end to Explain to him why he should not. And beleive me,,William does not under stand the way I express myself either. But we send messages back and forth until we understand each other.. John M. has gone to wits end explaining to me why I couldn't hit KJH-7 when I first Started. But He didn't give up. He pushed me into learning a lot more than I wanted to, And I thank him and others for that.

Now to the meat of this.. I would agree that your in a spot that needs assistance. (What I call) "a lower level digi" such as KG4FZR-7 somewhere in that would be of assistance to all in that area.
If there is a Station in that area that can provide good to great coverage. I would think that would be the best option.
Using a station that only helps 2 or 3 and leaves out others in that area is not what I call a good station. but shoot for the best that is avaliable.

Again, I am not pickin on you, I'd rather pick on Scott/NA4IT... he's more fun a "ROUNDER"
.

No problem Scott. He didn't even realize he was setup that way. I gave him a brief explanation & he changed his path. Don't know if you know Jordan, but I think he's rather new to APRS. I think he understands better what was taking place by having his UNPROTO set the way it was.

Thanks,
Travis
N4TJM

PS - Thx for all the discussion the past couple of days and explanation of the discussion. I've been on APRS for 7 years or so, but UNPROTO paths still get me some of the time. I enjoy figuring out what you guys are talking about after catching up on the emails. Good work!

Well, that helps clarify our decision. The votes, as of now, are leaning toward the Hustler G4-144B. Guess in the next couple of days, hopefully we can decide that's the one we want & can go ahead and get it ordered.

Thx,
Travis

Yes Scott KD4CWB suggested that the antenna be UNDER 10' do to the weather conditions. He said use 2 standoff mounts one at the bottom and one at the top to help renforce it. If I remember right I beleve it has a N connector on the coax.

Was there not a maximum length on the antenna?

Maybe it was 10 Ft or less?

Does it need a type N connector on it?

1956. Re: [EastTNAPRS] Digi Antenna - re-visited

Yahoo group: EastTNAPRS
Date: 2006-05-30 01:46:15 UTC
From: David Hoffman
Topic: 1928 Message: 1956

I have used the Comet GP-6 on my repeater and like it very well.? This is the antenna I used when we did the repeater testing for the Cherahala Challenge near Rock Creek Knob in NC.? The GP-3 is the smaller antenna and the GP-9 in the larger antenna.? I have the one in the middle.? This is why I was recommending the Comet GP-9.? It is 17' long with better gain and can be anchored near the top as well as at the bottom since this will be a side-mounted antenna to help with the wind support.
The antenna fund is currently?at $235.
David Hoffman - KE4FGW

From: Travis J. Maclay
Topic: 1928 Message: 1957

David,

Good info. I missed that antenna altogether. I think from further clarification today, we are going to be limited to 10' on antenna height. We will also need to adapt PL-259 to N to connect to existing coax.

Date: 2006-05-30 02:20:45 UTC
From: David Hoffman
Topic: 1928 Message: 1959

The antenna needs to come with which connector, the "N" or the SO-239?

David Hoffman - KE4FGW

Yes Moe, Thanks. I tried to go back and re-read all the emails pertaining to the new digi site and antenna when I created that spreadsheet. I wanted to highlight the project. I missed that very important piece some how.

However, I'm happy that we have it back at the top of everyone's priority list and am voting on something. I think we should move on this wonderful offer from Scott and not pass it up.

1964. YahooGroups lag time

Yahoo group: EastTNAPRS
Date: 2006-05-30 12:39:52 UTC
From: Travis J. Maclay
Topic: 1964 Message: 1964

I've noticed recently there is a MAJOR log in some emails being passed thru the group server. There are still emails to date that were sent & I still have not received them. I only discovered this by logging into the yahoogroups site and reading messages thru that interface. I noticed that people were replying to messages that I had not yet received.

I'm curious if this is just my mail server or if this is consistent across the group. FWIW, I did log into my mail server via webmail just to verify that I had not received it and sure enough, I had not. There is still one email in particular that I have yet to receive that was sent yesterday afternoon according to Yahoo Groups page.

From: William McKeehan
Topic: 1964 Message: 1965

I've seen situations where my post has taken a while to get to the mailing list at least when I respond to e-mails like this one.

I'm sending this one at 8:58 AM on Tuesday...let's see how long it takes to get around.

I have also submitted a query to the Yahoo! Customer Care group to see if they can explain why we're seeing the delay.

Topic: 1964 Message: 1966

This has happened to me also from time to time. What's worse for me is Yahoo seems to to have forgotten what my password is. When I request to have it reset, it never sends me the email that it says it's going to send me so that I can reset my password. I've been in limbo since Saturday now on this issue.

Sometimes there isn't a delay, there simply is no email ever. A
particular email will never get sent out but it exists when you log into
the group on the web and go to messages.

From: Christopher George
Topic: 1964 Message: 1968

David,

Try this, check your computer clock, its 4 minutes fast. I recieved your last post immediately, but it said the time of you post was 9:14, and my clock said it was 9:10. I have all the clocks at QTH set to WWV.

1969. New poll for EastTNAPRS

Yahoo group: EastTNAPRS
Date: 2006-05-30 13:20:03 UTC
From: EastTNAPRS@yahoogroups.com
Topic: 212 Message: 1969

Enter your vote today! A new poll has been created for the
EastTNAPRS group:

We have had issues with the e-mail flowing from
the Yahoo! group. Do we want to stick with Yahoo!
groups or change to Google Groups or something else?

o Yahoo!
o Google
o Other (please specify in an e-mail to the group)

To vote, please visit the following web page:
http://groups.yahoo.com/group/EastTNAPRS/surveys?id=1598425

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups
web site listed above.

Thanks!

Yahoo group: EastTNAPRS
Date: 2006-05-30 13:51:22 UTC
From: Kevin R. Colvin
Topic: 212 Message: 1972

My 2 Cents...
David, I had a problem with Yahoo and my password. They changed it on me. (Made me really Mad too) I had them RED FLAG it and I basicly unjoined Yahoo. A little later I re-joined. That is why you see ff943 vs my call when I post to the group. But since I have noticed no problems. Other than the Lag time which is being discussed.

Now... Unless I missed something (very possiable) should we not wait and see what Yahoo's responce is ?

also.. Would it not be better to discuss changing the group server/provider (or what ever Yahoo groups is) before Voting ?

this was sent/posted at about 13:52z 05/30/06 (clock was set using aprs server clock)

I'm set to WWV also.

I have a wall clock that does WWV also and it looks to have the same time as my computer.

Maybe Yahoo!'s clock is off?

Well, I have a question. I will try to explain/ask, but I am not knowledgeable on this.

E-Mail News Groups / E-Mail News Client . It is basicly like e-mail. You can access it from most E-Mail programs (that I have Used) or you can down load a News Group Reader.

I do not know if News Group style of groups can be SPAM Blocked or not. If it can not. This would be a BAD-BAD Choice.

I just thought I'd throw this out there , Be it GOOD/BAD/or/INDEFFERENT.

At least with this one you dont have to belong to Group, as long as you have E-Mail Access.

And Since most Ideas I throw out are bad ideas, I will just assume this one is most likley a BAD IDEA too.. But I am at least thinking.

1977. WX stuff on APRS

Yahoo group: EastTNAPRS
Date: 2006-05-30 23:03:23 UTC
From: Travis J. Maclay
Topic: 1977 Message: 1977

I'm curious if any documentation exists that would help explain to me what I'm seeing on APRS anytime a cloud comes into the sky around the Knoxville area. The radio has been non-stop for the past two hours from WA4RYW-1 distributing weather packets. I'm seeing all kinds of icons on the map of different things. At times, I see counties shaded in various colors, but only for 1-2 seconds before the color goes away. From time to time, I see large green boxes around certain areas.

I know the colored counties going away is a problem that some are aware of. I'm mainly asking if there is some way for someone to explain what all MRX sends out and what it all means. Some layman's explanations would be great. Assume we know nothing, cause that's fairly accurate here in my case.

Thanks!
Travis

1980. RE: [EastTNAPRS] New poll for EastTNAPRS

Yahoo group: EastTNAPRS
Date: 2006-05-31 02:20:16 UTC
From: David Hoffman
Topic: 212 Message: 1980

Wait, the GP-9NC costs $199.95.? It's the?GP-6NC that is only $159.95 at HRO.? It's the 10'2" antenna.
David Hoffman - KE4FGW

1981. Re: WX stuff on APRS

Yahoo group: EastTNAPRS
Date: 2006-05-31 02:27:28 UTC
From: Scott
Topic: 1977 Message: 1981

Travis,

If you are hooked up to the internet, you can right click the sybols / objects and click "Finger WXSVR" and read the text of the warning.

Other than that, double click this object and look at it's data box. It will tell you what type of watch / warning it is, and if it has WX data, it will show you direction of travel and speed of travel. The symbol / object is usually place at "the center of maximum concern". If the storn is traveling fast enough (I think 15MPH of greater) there should be a little red "tail" coming out of the object. Take your mouse and draw a range line in line with the little tail, and you can project where the storm is supposed to hit.

Hope that helps a little. Yes the WXSVR is acting a little screwy, in that the objects are not being deleted at the right times (some as late as 3 hours) and the county shapes "flash" off and on few times after they expire. Hopefully they will figure out what is going on (and I don't exactly know who "they" is...).

Scott NA4IT

1982. Digi Antenna Voting Poll

Yahoo group: EastTNAPRS
Date: 2006-05-31 19:51:06 UTC
From: David Hoffman
Topic: 1982 Message: 1982

I just casted a vote for:
Other - please specify in email to group
My other choice would be to purchase the Comet GP-6NC commercial grade antenna for $159.95 from HRO.? It is 10' 2" in length and has a wind rating of 112 MPH if mounted at the bottom only.? I say we support it at the top as well and have even a higher wind rating.??That's my vote.
Yahoo customer service corrected my password issue for me.? So now I can?log in to the Yahoo Groups again.

1986. WX Weather Boxes and UI-View

Yahoo group: EastTNAPRS
Date: 2006-06-01 01:04:44 UTC
From: Kevin R. Colvin
Topic: 1986 Message: 1986

OK GUYs..... Time to see if anyone can help..

I am trying to exclude all that WX stuff and here is what I did and what happened. (IT DIDN'T WORK)

I first deleted all of the green and yellow and red line boxes
them in UI-View, I went to SETUP then EXCLUDE/INCLUDE LIST...clicked on it... it will open a window...

on the left hand side you should see two big windows and below them two small windows.
I put my cursor in the small window below EXCLUDE CALLS and NAME OBJECTS.

In that box I typed in the XXX* of the objects i did not want to see.
SPC* (for the WATCH boxes)
OHX* (for the Nashville warning area)
HUN* (for the Huntsville Warning area)
MRX* (for Morristown warning area.)

then clicked OK...

This seemed to work but after a short time, I saw the YELLOW boxes pop back up, No Icon just the boxes.

I tried to exclude them by "X"ing the Boxes in EXCLUDE BY POSIT TYPE... did not work...
I tried to exclude them by "X"ing the Boxes in EXCLUDE BY TRAFFIC TYPE... did not work...

Any ideas how I can get rid of them color boxes, (other than just shutting APRS down and leaving it off) ?

Kevin;

Go in to UI-NWS and clear all objects & messages

Close UI-NWS

Delete all remaining objects from map Right click & delete

It worked for me

You can restart Ui-NWS when you want more pain.

Thanks Roy,
I have not had UI-NWS running for 4 days now. Have re-booted several times..

I re-checked UI-NWS and it is empty and closed it out. will try this again Thanks..
_____
Thanks Moe,
It's not the county underlay/overlay. Got rid of them when I closed out UI-NWS.
It's the colored out-line boxes that keep comming back.. (Boxes, but no Icon)
going to try Roys suggestion. If you have any other ideas, plse post or send them direct to me..TNX.

1993. WX Shapes don't expire until 01 JULY

Yahoo group: EastTNAPRS
Date: 2006-06-01 03:52:53 UTC
From: Scott
Topic: 1993 Message: 1993

Anyone else notice that the WX shapes on screen right now don't expire until 01 July?

There is a huge bug in the WX system somewhere, and it is getting bigger each day. It looks like we may have to discontinue sending the WX stuff out to RF.

About a week or so ago, all the WX objects and boxes started staying on screen up to 3 hours past their expire time. I have monitored closely today, and there are no "kill" packets being sent to expire them.

Now the wrong expire date on the shapes.

This isn't an "APRS" problem, it is either a WX service problem or a server problem.

I did contact the guy who came up with WXSVR and his comment was that he thought the stuff wasn't used much anymore, and he was thinking about discontinuing the WXSVR.

So, maybe we are about to loose the system all together. It's a shame. In my opinion, it has been really helpful. There have been times that the WX service TX in Chattannoga has been down, and the only warnings we got came through APRS.

Comments?

From: Travis J. Maclay
Topic: 1986 Message: 1995

I too closed UI-NWS, restarted UI-View, and all was well. I too, for the record, put MRX* in my exclude list.

A third thing I had to do was go into UI-NWS, go to settings, uncheck for it to start when UI-View starts.

After doing these 3 things, all icons & shaded boxes were gone. Would be nice if it worked, but I got tired of hearing the siren 3 hours after it expired.

1996. Poll results for EastTNAPRS

Yahoo group: EastTNAPRS
Date: 2006-06-01 06:38:49 UTC
From: EastTNAPRS@yahoogroups.com
Topic: 254 Message: 1996

The following EastTNAPRS poll is now closed. Here are the final results:

POLL QUESTION: In light of the upcoming new paradigm digi antenna purchase, which antenna would you recommend we purchase? A personal recommendation has come from Joe Riner for either a Hustler G6-144B or a Hustler G7-144. Others have had good experience with a Comet or Diamond.

CHOICES AND RESULTS
- Comet CA-ABC 22a (6.5dBi - 9'5") $75.95, 0 votes, 0.00%
- Comet CA-ABC 23 (7.8dBi - 13'4") $109.95, 0 votes, 0.00%
- Diamond CP22E (6.5dB - 9'0") $54.95, 0 votes, 0.00%
- Diamond F23A (7.8dB - 15'0") $129.95, 0 votes, 0.00%
- Hustler G6-144B (6dBd - 9'9") $129.95, 3 votes, 37.50%
- Hustler G7-144 (7dBd - 15'4") $189.95, 3 votes, 37.50%
- Other - please specify in email to group, 2 votes, 25.00%

INDIVIDUAL VOTES
- Comet CA-ABC 22a (6.5dBi - 9'5") $75.95

1997. New poll for EastTNAPRS

Yahoo group: EastTNAPRS
Date: 2006-06-01 06:45:00 UTC
From: EastTNAPRS@yahoogroups.com
Topic: 212 Message: 1997

Enter your vote today! A new poll has been created for the
EastTNAPRS group:

Since our new digi antenna has a few requirements such as a 10' height limitation and needs to terminate to a "N" type connector, it looks as if the Comet GP-6NC is a better choice. So, this poll will help decide whether we purchase that antenna now. So, cast your vote, poll is open for 2 days.

o Purchase Comet GP-6NC when this poll closes
o Continue to discuss and/or research other antenna options

To vote, please visit the following web page:
http://groups.yahoo.com/group/EastTNAPRS/surveys?id=1600180

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups
web site listed above.

Thanks!

From: Scott
Topic: 1993 Message: 1999

I think I light of the wierd data coming out of the WX servers, it is probably best we discontinue gating the WX to the RF side of APRS.

Topic: 254 Message: 2000

I think those that donated something towards the antenna fund should be those that are allowed to vote on what type of?antenna to buy.? I think that for every dollar that you donated to the antenna fund, you get 1 voting point towards the antenna of your choice.? There are six people how actually put any money towards this purchase but there were 8 votes made.? So for those how donated handsomely towards this antenna have the same amount of voting power as those who didn't donate anything at all.? Interesting!? That is my 2 cents worth.

2002. WXSVR update

Yahoo group: EastTNAPRS
Date: 2006-06-01 12:46:27 UTC
From: Scott
Topic: 2002 Message: 2002

In checking the UI-VIEW Yahoo Group, the fella who does WXSVR had posted that the computer doing WXSVR is having pretty severe problems.

Also, he has stated he may not put it back on, because he is not seeing enough "hits" per se through the "Finger WXSVR".

I pointed out to him the huge amount of data that is automaticly put out US wide on the RF side of APRS, and the fact that it does save lives.

Sad day...

Scott NA4IT

From: EastTNAPRS@yahoogroups.com [mailto:EastTNAPRS@yahoogroups.com] On Behalf Of David Hoffman
Sent: Wednesday, May 31, 2006 3:51 PM
To: EastTNAPRS@yahoogroups.com
Subject: [EastTNAPRS] Digi Antenna Voting Poll

I just casted a vote for:

Other - please specify in email to group

My other choice would be to purchase the Comet GP-6NC commercial grade antenna for $159.95 from HRO. It is 10' 2" in length and has a wind rating of 112 MPH if mounted at the bottom only. I say we support it at the top as well and have even a higher wind rating. That's my vote.

Yahoo customer service corrected my password issue for me. So now I can log in to the Yahoo Groups again.

I was looking at the specs on the Comet GP-6NC in preperation for probably voting for it in the poll when I realized that it is rated for a 1.5:1 SWR in the range of 153-157 Mhz. This antenna isn't designed for 2 meters!

You can see a picture and the specs at
http://www.cometantenna.com/newPro_detail.php?ID=145

From: David
Topic: 212 Message: 2006

The Hustler G7-144 does have an N connector. However, it is a 15.3 foot antenna with a 100 MPH wind rating. It has 7dBd gain. I noticed that down at 144.39MHz, the SWR becomes higher than 2.0:1.

I own a G7 and you cant re-adjust it / re tune it for a very low swr on 144.390 since you are not going to be changing freqs like you would on your home radio.
But the length is a long one..

Just my 2 cents...

I am going to open my mouth on this comment.

I kinda agree with David.. Not so sure on the vote per dollar idea though..

I did not donate, so I did not vote.. that seemed right to me.

I think those that donated something towards the antenna fund should be those that are allowed to vote on what type of antenna to buy. I think that for every dollar that you donated to the antenna fund, you get 1 voting point towards the antenna of your choice. There are six people how actually put any money towards this purchase but there were 8 votes made. So for those how donated handsomely towards this antenna have the same amount of voting power as those who didn't donate anything at all. Interesting! That is my 2 cents worth.

I've uploaded a file in the files area that compares quite a few of the antennas.? I shaded the ones that are 10'6" or less in height and that have the N connector.? So now we can look at what our choices are of those that have N connectors.

2015. [Fwd: GP-6NC Question]

Yahoo group: EastTNAPRS
Date: 2006-06-01 20:53:56 UTC
From: David Hoffman
Topic: 2015 Message: 2015
Attachments: 1 described; binary payloads are missing from this source WARC

OK everybody, I've pulled my suggestion on the GP-6NC.? My fault that I didn't look more closely.? It is a commercial grade antenna, but it is designed for commercial frequencies.? This antenna will not work for the planned digi.? I have created a spreadsheet in the files area listing a bunch of antennas and highlighted some possibilities.? We would like to limit the height of whatever we buy down to 10 foot or less.? Also, the antenna needs to come with an "N" connector.? So the GP-6NC from Comet will not work.? Now the regular GP-6 would be nice, but it comes with an SO-239 connector.? In order to stay with the "N" type connector and keep the length small, we are very limited in what's available.? The spreadsheet reveals this.? I do not know how much tuning can be done on these antennas, let alone bringing a commercial antenna down to 144.390MHz.
David Hoffman - KE4FGW

---------- Original Message ---------- Subject: GP-6NC Question
From: "Tom Keeble"
Date: Thu, June 1, 2006 8:34 pm

RE:

GP-6NC

VHF/UHF Dual Band Antenna
1.5:1 or less SWR: 153-157/460-470MHz
Gain: 6.5/9.0dBi
Max power: 200 watts
Length: 10 ft 2 inches
Weight: 3 lb 8 oz
Connector: N-female
Construction: Two piece white fiberglass
Max wind speed: 112MPH

Question...can this antenna be tuned to single frequency 144.390MHz (Natl. APRS Frequency)?

From: Travis J. Maclay
Topic: 254 Message: 2017

David,

I am all for purchasing the antenna tomorrow morning. I created a poll because no one else was taking any action on it. I'd like to not lose the opportunity to get the digi up ASAP, but I realize that others besides myself made a financial contribution to the project. I do not know of a way to poll just the people who gave money, so I did it the way I did. If we want to count only the votes of the givers, we can do that. I simply want to move while we have an offer for a great location.

I am all for purchasing either antenna. If it helps, I now officially cast my vote for the Comet, all because William did ;-) Just kidding about that, but seriously, I don't know antennas. I couldn't begin to explain theory about them to anyone, I just want to be prudent & take the offer that's on the table while it's there.

So, that's my vote - buy it soon, whatever it is.

Travis

Scott,
Could you post his name and e-mail address, Scott? Perhaps if he hears
from enough people he will rethink his position on this. Another thought I had
was that perhaps the WX service could help him subsidize this somehow
financially...perhaps some kind of grant. If the NWS wants amateur radio spotters
as they say they do, the need to help us with our work. Knowing the warned
areas without constantly monitoring the weather radio is a plus.

Don,

A little bit of research and anyone can come up with his address.
Albeit, he is on Earthlink, and an inundation of messages will
probably shut down his email account.

He is a member of the UI-VIEW Yahoo group. It would probably be best
to post messages there.

2021. WXSVR IS ALIVE AGAIN!

Yahoo group: EastTNAPRS
Date: 2006-06-03 21:58:39 UTC
From: Scott
Topic: 2021 Message: 2021

The WXSVR went alive again today around 12:30PM as best I can tell. It does seem to be working properly. As far as I am concerned, KG4FZR-7 will once again be gating MRX and SPC on Monday. Right now, I am currently doing that.

Ed Dial: if you killed the stuff in RYW and want to put it back, I think it will work right now.

I did contact the WXSVR owner and sysop, and let him know we appreciate him putting it back on. I also asked him how the amateur community could help him out, and if he responds, I'll post that here.

From: Bob Thomas
Topic: 1915 Message: 2022

the kantronics kpc-3 plus tnc's that are setup as node/digis do that. the ky KF4OWQ-2 digi has the call substitution firmware that ALL wide area node/digis should be upgraded to. KF4OWQ-2 is more than likely a kpc-3+ model. it heard and responded to the "wide2-1" in the path, substituted it's call, then forwarded on to "wide2", the last link in the unproto path. the "*" asterisk(generated by your equipment) lets you know you heard that station directly. the bottlenecks in the system are the stations that can't do that substitution and the the "wideN-N" is not repeated by them. The East TN wide area network has a few of these major bottlenecks...that's why you don't see stations beyond your local area very often. Get on the internet and there's lots of aprs stations in our state that we don't see on packet... now i need to go to sleep and dream up a way to fix this!

Subject: [EastTNAPRS] Another strange log event

While I was sleeping, I had my machine {rf) sending out a beacon of
KF4YMC>ID,WA4KJH-7,WIDE2-1
but when checking that machines log I saw this KF4YMC>ID,KF4OWQ-2*,WIDE2*

KF4OWQ-2 Digipeater London, KY

Could this be that digi striped and replaced the path? This ocured around 08:08: 42 by that computors clock which is about 2 minutes slower than this putor.

2023. [Fwd: [tnballoon] TABEL-3 Launch Date]

Yahoo group: EastTNAPRS
Date: 2006-06-05 21:15:40 UTC
From: David Hoffman
Topic: 2023 Message: 2023

If anyone is interested in chasing for Vanderbilt University, they are scheduling a flight coming up soon.? Not sure yet where the predicted landing site will be, but it's coming our way.
David Hoffman - KE4FGW

---------- Original Message ---------- Subject: [tnballoon] TABEL-3 Launch Date
From: "Bruce W. Martin, KQ4TV"
Date: Mon, June 5, 2006 5:09 pm
To: tnballoon@yahoogroups.com

Terry and I talked last week about a Launch Date for TABEL-3 on June 24. Turns out I have a family commitment that day that I should not miss. How about July 1? I don't see launches on the schedule for the UT or Huntsville Groups.

Please let me know how this will work with your schedule.

I am also looking to get the names of those that will join us for the Launch and/or recovery. I would like to try and be sure we have at least three chase teams for recovery, one of which will leave for the predicted landing site before or immediately after the launch.

I would like to be sure that the chase vehicles are maned by a two person team (driver and spotter).
Running solo last time was difficult and potentially dangerous.
I saw by Terry's example that having two people made for a safer chase. I think the chase teams should have the following capabilities:
1. UHF or dual band mobile for voice communications to coordinate
with other teams.
2. APRS capable setup to be able to monitor one of the trackers on
the flight.
3. VHF direction finding equipment. Preferably portable.

A Kenwood TM-D700 would satisfy both 1 and 2 above.
A Kenwood TH-D7A would satisfy 2.
A VHF radio/TNC/Computer combination with APRS client would also satify 2.
A VHF portable with an Arrow 2m beam antenna would satisfy 3.

These are not requirements but suggestions for the team capabilities. All are welcome.
If you can satisfy part of the above and are looking for a teammate for the rest, please post to the list and try to coordinate that.

I would like to have a Payload and Launch Review meeting about a week before the launch to be sure we know who is bringing what and a quick design review of the payloads. Not every one participating needs to be at the review but I would like to have all payload components there and info about support components that will be brought to the launch site. I also

would like a good count of those who will be at the launch and those that will participate in the chase and recovery.

Please pass this information along to others who might be interested in participating.

If I have left something out, let me know.

Thanks,

Bruce

Subject: Re: [EastTNAPRS] Another strange log event

the kantronics kpc-3 plus tnc's that are setup as node/digis do that. the ky KF4OWQ-2 digi has the call substitution firmware that ALL wide area node/digis should be upgraded to. KF4OWQ-2 is more than likely a kpc-3+ model. it heard and responded to the "wide2-1" in the path, substituted it's call, then forwarded on to "wide2", the last link in the unproto path. the "*" asterisk(generated by your equipment) lets you know you heard that station directly. the bottlenecks in the system are the stations that can't do that substitution and the the "wideN-N" is not repeated by them. The East TN wide area network has a few of these major bottlenecks...that's why you don't see stations beyond your local area very often. Get on the internet and there's lots of aprs stations in our state that we don't see on packet... now i need to go to sleep and dream up a way to fix this!

Subject: [EastTNAPRS] Another strange log event

While I was sleeping, I had my machine {rf) sending out a beacon of
KF4YMC>ID,WA4KJH-7,WIDE2-1
but when checking that machines log I saw this KF4YMC>ID,KF4OWQ-2*,WIDE2*

KF4OWQ-2 Digipeater London, KY

Could this be that digi striped and replaced the path? This ocured around 08:08: 42 by that computors clock which is about 2 minutes slower than this putor.

2025. Poll results for EastTNAPRS

Yahoo group: EastTNAPRS
Date: 2006-06-06 13:34:52 UTC
From: EastTNAPRS@yahoogroups.com
Topic: 254 Message: 2025

The following EastTNAPRS poll is now closed. Here are the final results:

POLL QUESTION: Since our new digi antenna has a few requirements such as a 10' height limitation and needs to terminate to a "N" type connector, it looks as if the Comet GP-6NC is a better choice. So, this poll will help decide whether we purchase that antenna now. So, cast your vote, poll is open for 2 days.

CHOICES AND RESULTS
- Continue to discuss and/or research other antenna options, 2 votes, 33.33%
- Purchase Comet GP-6NC when this poll closes, 4 votes, 66.67%

2026. RE: [EastTNAPRS] Dgi Antenna Comparisons

Yahoo group: EastTNAPRS
Date: 2006-06-06 14:37:19 UTC
From: Travis J. Maclay
Topic: 2012 Message: 2026

David,

In looking at your antenna comparisons, I see only two antennas listed that meet both criteria of under 10' and having an "N" type connector. My questions are:

1) Do we as a group purchase one of these two antennas, namely the Hustler G6-270R (which is a dual band antenna) or the Diamond X50NA? The Hustler is 8' 6" in height and the Diamond is only 5.6' tall.

2) Do we even consider a different antenna with SO-239 with the understanding of the loss from an adapter so that we have other options?

3) Are there options to change his "N" type feed line to PL-259?

I'm asking these questions since I've not seen any other activity on this. Maybe my questions are whacko, which is fine, just let me know. I'd like to see us move quickly on this. Let's decide in the next couple of days. If you have given money and want your vote to count, now's your time to chime in. We need to buy this antenna soon!

Thanks guys!
Travis

I've uploaded a file in the files area that compares quite a few of the antennas. I shaded the ones that are 10'6" or less in height and that have the N connector. So now we can look at what our choices are of those that have N connectors.

2027. Re: Dgi Antenna Comparisons

Yahoo group: EastTNAPRS
Date: 2006-06-06 15:29:59 UTC
From: David
Topic: 2012 Message: 2027

Well my comments on the "N" connector. More than likely, Scott is using hardline on this tower and has offered us a piece of it for the digi. The "N" connector is a more common a connector for use on hardline. In fact, I don't know of any PL-259 connectors that exist for use on hardline. Maybe so, but I think we will be better off staying with the "N" connector anyway. Now the only problem with that is that there simply are not many smaller length antennas that come with "N" connectors. Most antennas that come with an N" connector are for use on more serious antenna installations that are longer than 10'. If we have to stay under 10', then you are right, the spreadsheet shows two antennas that will work. Even though the Hustler G6-270R is a dual band antenna, it has the higher gain of the two. It is a 5/8 over 5/8 collinear on 2 meters. It is a one piece tapered fiberglass radome antenna that is made in the USA of high quality American materials. It has a 10MHz bandwidth on 2 Meters which seems kind of high. But that means we should get some pretty good SWRs out of it on 144.390 MHz. I think we should go ahead and get this one, but that is just my opinion. It is a $200 + shipping antenna though.

Subject: Re: GP-6NC Question

Tom,

The antenna you described is tuned for the comercial bands, you need the
Amateur radio version:

Model GP-6

It is pre-tuned for: 144-148MHz and 440-450Mhz

It is available from all the US dealers.

RE:

GP-6NC

VHF/UHF Dual Band Antenna
1.5:1 or less SWR: 153-157/460-470MHz
Gain: 6.5/9.0dBi
Max power: 200 watts
Length: 10 ft 2 inches
Weight: 3 lb 8 oz

Connector: N-female
Construction: Two piece white fiberglass
Max wind speed: 112MPH

Question...can this antenna be tuned to single frequency 144.390MHz (Natl. APRS Frequency)?

David,

If you have not received any objections by end of day today, WEDNESDAY, please purchase the antenna you mentioned below. Anyone who has given money towards this project has this one shot to raise any questions before we purchase this antenna. If you do not reply TODAY with an objection, then we all would say that you agree that we purchase the Hustler G6-270R.

So, here goes. David, if no objections, let's order on Thursday & get it on its way.

If you do have an objection, we need you to give an alternative brand & model number that meets all 3 criteria:
1) Under 10' limitation
2) "N" type connector
3) Tuned for 144-148 MHz

73,
Travis

From: David Hoffman
Topic: 2012 Message: 2032

I concur with this suggestion on all accounts.? I think by end of today, is long enough to decide.? We are at $260 in the antenna fund.? I would not use the SO-239 to "N" adapter as that will give us some signal loss.? Besides, using the adapter only allows us a bigger range of smaller antenna to choose from.? I think we can on agree that the G6-270R meets all of these 3 requirements.? Plus it has a higher gain hen our only other option.? So I agree we order the Hustler G6-270R antenna on Thursday.? Universal Radio out of Ohio will ship that antenna for $10 according to their website.? So our total would be $210.? HRO wants more to ship it.

2033. UX-8 Mission "Pie in the Sky" scheduled for RACK Hamfest

Yahoo group: EastTNAPRS
Date: 2006-06-08 01:46:39 UTC
From: Greg Williams
Topic: 2033 Message: 2033

In lieu of the postponement of the "Even Steven" flight, we got together Tuesday night and decided to pull the minimal resources we have and do a demo mission launching from the Knoxville Hamfest at Kerbela Temple! This afternoon we got the go for launch from RACK and Kerbela and we are hoping for blue skies and calm winds.

UX-8 is called project "Pie in the Sky". Why, you ask? Well, we are setting out to do what might be a first: Send Moon Pies to near space! Yes, *MOON PIES*, like the ones you eat. Why? Well, it kinda went from a picnic basket launch (dont ask) to sending food up that we can (hopefully) snack on when they come back down. We want to do a demo and a "PR stunt" and make this a fun event for everyone.

We will have a "tinytracker" for the flight (yes, we know, but it is a demo flight so it shouldn't be up long) and as many Moon Pies as we can cram in to a box.

Launch time is/ /for *Noon *at the Kerbela Temple. We are working around the hamfest folks and the forums, so as not to overlap or interfere with another forum. The Hamfest is slated to run from 9AM to 4PM. We want to have our volunteers given the opportunity to enjoy the hamfest as well as plan for chasing should they desire.

Greg Williams (K4HSM) is heading up the launch team.
Travis Maclay (N4TJM) is heading up the chase team.
Dan Bowen (K2VOL) and Mike Coffey (KJ4Z) are assisting with logistics and information.

We will solicit volunteers from the crowd to assist with inflation and launch of the payload. Announcements of the launch at the hamfest are being planned for in advance of the flight in order to give everyone interested a chance to participate.

Since this is a demo flight, only the tracker/GPS is scheduled to go, and maybe some QSL cards and a camera if one can be procured...and, of course, the MOON PIES. We plan to simply inflate the balloon as much as possible and then let it go. Present predictions show that it is slated for landing in or near the Smoky Mountains on a Southeastern track. We will continue to update the web page as we get new data on possible landing sites.

We will need other help as well. We've been offered space to set up a donation jar and brochures to pass out, so that we can promote UTARC. We could use a couple of the students to assist with that.

We also could use an APRS setup and spare radio to monitor chase team communications as they track UX-8.

Please come out and support UTARC and RACK and have some fun, and some *moon pies*!!!

Flight: UX-8 (Pie in the Sky)
Date: June 10, 2006
Location: Kerbela Temple parking lot, Knoxville, TN
Time: Noon Eastern Time
Frequency (144.390 APRS)
Payload: Tinytracker, box of Moonpies, QSL cards
Purpose: Demonstration of balloon launch, generate more interest from community.
Duration: Less than one hour in the air

Items needed:

* Donation Jar (possibly use the box that Even Steven was to be placed in)
* Brochures (can someone create and make some demo brochures about UTARC?)
* APRS Setup to show track of UX-8

Please contact Dan Bowen or myself if you would like to help. Dan's email (he is out of town until Friday) is dbowen1@... and my email is k4hsm@.... Travis' e-mail is tjmaclay@... if you're interested in chasing.

The web site for more information is *http://balloon.utarc.org.
*
RACK Hamfest information can be found at *http://www.w4bbb.org*.

2034. Digipeater site possibility

Yahoo group: EastTNAPRS
Date: 2006-06-08 01:57:18 UTC
From: tennesseestargazer
Topic: 2034 Message: 2034

I am building a 440 repeater (443.750/448.750). It may be possible for me to install a digipeater in the same rack since I have to install my antenna at the site. The 350ft tower is near I75, Racoon Valley Road.

I also heard rumors of a tower owner that is willing to give ham operators free access just off I75 near the onieda/huntsville exit. I am checking on that. I will let the group know.

If I can set my 440 repeater up at the site I hope, I have a Motorola Micor radio that can be modified that could be used I believe as a digipeater transceiver.

Subject: [EastTNAPRS] UX-8 Mission "Pie in the Sky" scheduled for RACK Hamfest

In lieu of the postponement of the "Even Steven" flight, we got together Tuesday night and decided to pull the minimal resources we have and do a demo mission launching from the Knoxville Hamfest at Kerbela Temple! This afternoon we got the go for launch from RACK and Kerbela and we are hoping for blue skies and calm winds.

UX-8 is called project "Pie in the Sky". Why, you ask? Well, we are setting out to do what might be a first: Send Moon Pies to near space! Yes, MOON PIES, like the ones you eat. Why? Well, it kinda went from a picnic basket launch (dont ask) to sending food up that we can (hopefully) snack on when they come back down. We want to do a demo and a "PR stunt" and make this a fun event for everyone.

We will have a "tinytracker" for the flight (yes, we know, but it is a demo flight so it shouldn't be up long) and as many Moon Pies as we can cram in to a box.

Launch time is for Noon at the Kerbela Temple. We are working around the hamfest folks and the forums, so as not to overlap or interfere with another forum. The Hamfest is slated to run from 9AM to 4PM. We want to have our volunteers given the opportunity to enjoy the hamfest as well as plan for chasing should they desire.

Greg Williams (K4HSM) is heading up the launch team.
Travis Maclay (N4TJM) is heading up the chase team.
Dan Bowen (K2VOL) and Mike Coffey (KJ4Z) are assisting with logistics and information.

We will solicit volunteers from the crowd to assist with inflation and launch of the payload. Announcements of the launch at the hamfest are being planned for in advance of the flight in order to give everyone interested a chance to participate.

Since this is a demo flight, only the tracker/GPS is scheduled to go, and maybe some QSL cards and a camera if one can be procured...and, of course, the MOON PIES. We plan to simply inflate the balloon as much as possible and then let it go. Present predictions show that it is slated for landing in or near the Smoky Mountains on a Southeastern track. We

will continue to update the web page as we get new data on possible landing sites.

We will need other help as well. We've been offered space to set up a donation jar and brochures to pass out, so that we can promote UTARC. We could use a couple of the students to assist with that.

We also could use an APRS setup and spare radio to monitor chase team communications as they track UX-8.

Please come out and support UTARC and RACK and have some fun, and some moon pies!!!

Flight: UX-8 (Pie in the Sky)
Date: June 10, 2006
Location: Kerbela Temple parking lot, Knoxville, TN
Time: Noon Eastern Time
Frequency (144.390 APRS)
Payload: Tinytracker, box of Moonpies, QSL cards
Purpose: Demonstration of balloon launch, generate more interest from community.
Duration: Less than one hour in the air

Items needed:

a.. Donation Jar (possibly use the box that Even Steven was to be placed in)
b.. Brochures (can someone create and make some demo brochures about UTARC?)
c.. APRS Setup to show track of UX-8
Please contact Dan Bowen or myself if you would like to help. Dan's email (he is out of town until Friday) is dbowen1@... and my email is k4hsm@.... Travis' e-mail is tjmaclay@... if you're interested in chasing.

The web site for more information is http://balloon.utarc.org.

RACK Hamfest information can be found at http://www.w4bbb.org.

2040. Pennsylvania Ballon Launch- APRS

Yahoo group: EastTNAPRS
Date: 2006-06-09 14:44:52 UTC
From: Scott
Topic: 2040 Message: 2040

From ARRL.net website...

"Pennsylvania launch of balloon carrying Amateur Radio payload set (Jun 9, 2006) -- A balloon carrying an Amateur Radio payload is set for launch Saturday, June 10, at approximately 1300 UTC (9 AM ET) from Samuel Lewis State Park, located just south of US Rte 30 between Lancaster and York, Pennsylvania. The "near space" launch is a project of Pennsylvania Leadership Charter School (PALCS). The balloon is expected to rise to an altitude of about 80,000 feet. An APRS beacon signal will transmit on 144.390 MHz, using the call sign NJ2BB-62. Every third transmission it will also transmit "PALCS PROJECT". A 2 meter MCW beacon on on 146.565 MHz also will continuously send "PALCS PROJECT" for one minute followed by "de NJ2BB" and a 30-second period of silence before repeating the sequence. Line of sight is expected to be between 350 and 450 miles. Send reception reports to AA2WN."

2043. UX-8 summary

Yahoo group: EastTNAPRS
Date: 2006-06-10 20:45:21 UTC
From: Greg Williams
Topic: 2043 Message: 2043

Here's my log for UX-8 as I have it:

*Launch *was at approximately 11:59:02, as that is the first packet received with a higher altitude, so give it +/- 10 seconds

Highest recorded altitude: 25398 ft - Location: 35.51.69N by 083.40.38 W - Time of packet was 12.27.40

Last packet in flight was at 12:51:06 - Location: 35.48.18N by 083.30.73 W, altitude of 2181 feet.

The packet after burst places the balloon at 24942 feet - Location: 35.21.65N by 083.40.17 W - Time of packet was 12:28:02.

Distance: 24.9 Miles (40.0 km) and it landed 115 degrees from starting point in relation to North.

Now for the real meat of the issue...the *moon pies* were *MELTED*. I don't think anyone wanted any when Jeff brought them by.

The QSL cards were returned and we will send these out with any QSL reports received on the 30m beacon.

The log file is online.* *I trimmed the log file to start about 15 mins prior to launch.
*
*The weather was perfect (a little too much sun for me) and the folks at RACK really helped us out by getting the word out and reserving space for us in their parking area.

Greg Williams, K4HSM

2045. TM-D700A digi for the Cherohalo Challenge

Yahoo group: EastTNAPRS
Date: 2006-06-12 13:09:07 UTC
From: David Hoffman
Topic: 2045 Message: 2045

William, Roy and the others,
I'd like to take your suggestions on setting up my?TM-D700A for use with the Cherohalo Challenge as a digi.? Can you send me a list of those suggestions so that I may review and implement them?? I plan to use the Comet GP-6 on the 700 at the Rock Creek Knob site for the challenge.? I think that will work real well for everyone.? Thanks
David Hoffman - KE4FGW

2046. Re: [EastTNAPRS] Digipeater site possibility

Yahoo group: EastTNAPRS
Date: 2006-06-12 19:11:32 UTC
From: William McKeehan
Topic: 2034 Message: 2046

I think the area north of Knoxville could use a digi and the area up near
Onieda may be a good spot for another WIDEn-N digi.

What do you guys that travel up that way (or down from KY) think about these
two locations? Do you think one would be better thatn the other?

2047. Re: [EastTNAPRS] TM-D700A digi for the Cherohalo Challenge

Yahoo group: EastTNAPRS
Date: 2006-06-12 17:49:14 UTC
From: William McKeehan
Topic: 2045 Message: 2047

NOTE, everything I'm about to describe is specific to the event this weekend.

Here are the recommendations specific to a Kenwood TM-D700:
3-5 Position Ambiguity: OFF
3-B Packet Path: WIDE1-1,WIDE2-1,WIDE3-1
3-C Packet TX: Auto
3-D TX interval: 1 minute
3-L UIDIGI: WIDE1-1,WIDE2-1,WIDE3-1
If you are stationary, then also
3-K Digipeater: ON
if you are mobile, leave 3-K set to OFF unless instructed to enable it by NCS.

I assume you have the basics setup, but I'll give you my settings as an example:
3-1 My Callsign: KI4HDU-7
3-2 GPS: NMEA
3-3 Waypoint: 9 digits
3-5 Position Ambiguity: OFF
3-6 Position Comment: In Service
3-7 Position Limit: OFF
3-8 Station Icon: Truck
3-A Status TX Rate: OFF
3-B Packet Path: WIDE1-1,WIDE2-1,WIDE3-1
3-C Packet TX: Auto
3-D TX interval: 1 minute
3-E Unproto: APK101
3-F Beep: Mine
3-G Mile/Kilometer: Mile
3-H Temperature: F
3-I Data Band: A
3-J Packet Speed: 1200
3-K Digi: OFF
3-L UIDIGI: WIDE1-1,WIDE2-1,WIDE3-1
3-M Auto MSG Reply: OFF

Now, the explaination of WHY I'm suggesting this.
1. There are several places where we will need 3 hops to get the packets to NCS.
2. All of the digipeaters that cover the route will respond to each of the aliases listed in the packet path (Digi's which support WIDEn-N will respond to each of these individual aliases).
3. We will have some (1,2 or 3) TM-D700's along the route that we may want to act as digi's.
4. The above settings can be enabled via the front panel of the TM-D700; WIDEn-N support can only be enabled/disabled by connecting a computer to the D700.
5. We do not want the D700's acting as WIDEn-N digi's after the event (so being able to turn it off easily is valuable).

Does this make sense?

On Mon, June 12, 2006 9:09 am, David Hoffman said:

2049. K4EZK-3 Tellico WIDE1-1 Digi

Yahoo group: EastTNAPRS
Date: 2006-06-13 03:37:37 UTC
From: Scott
Topic: 2049 Message: 2049

K4EZK-3 is now up. Charlie worked until after 10PM tonight to get it operating. The antenna is only at 30ft, but he plans to put it at 80ft soon. He has to line up some folks to climb the tower.

It responds (as best we can tell) to WIDE1-1 and K4EZK-3, and does do call sign substitution. KG4FZR-7 is hearing it and putting it on the internet, and also does a one hop RF out of it's Igate for it. Roy, WA4BDS is also hearing it most of the time.

K4EZK-3's beacon path is a simple one hop path, with no digis or aliases in the path, so many of you may not be able to see it. The beacon TX's every 10 minutes. This was the setup suggested for the older Kantronics TNC by Bob Bruniga.

Hope it helps. Everyone be sure to thank Charlie for his efforts!

Given these poll results, I do not believe there is a big enough problem (based on the low number of participants in the poll) to warant a move.

If anyone notices problems in the future (i.e., there is a message posted to the group that you do not receive), please let me know and I'll have the Yahoo! support team reserch it.

William;

Looks good to me except for the following;

3-D TX interval: 1 minute -- Only for mobiles Set to 30 to 60 Min
if at fixed location.

Also if in a fixed location set your Latitude & Longitude coordinates.

2058. RE: [EastTNAPRS] UI-View question

Yahoo group: EastTNAPRS
Date: 2006-06-13 13:45:00 UTC
From: Travis J. Maclay
Topic: 1754 Message: 2058

Here's how you do it:

1) Assuming you only want to see the balloon station on the map, go into setup, exclude/include lists, and in the box on the left, type "!AA4UT-11" without the quotation marks. This will exclude ALL stations on your map except AA4UT-11. The exclamation mark indicates an "include", which will exclude all stations but that station.

2) Under the actions menu, uncheck auto refresh.

3) Play your log file, you will see the station breadcrumb on the map.

When done, don't forget to delete the station from the include/exclude list or you will see no stations. Also, you'll probably want to turn auto refresh back on so you don't have a lot of old station locations on your map.

Hope this helps.

Subject: [EastTNAPRS] UI-View question

I wanted to show on my map the location and info about every packet put out by UX-8 balloon flight rather than one-at-a-time, but can't seem to find the setting in UI-View.

Can someone advise what I can set in order to do this?

Greg

2059. RE: [EastTNAPRS] Poll results for EastTNAPRS

Only people who use Yahoo email can be infected, according to Symantec.
So far, this has been true. If you are using your own ISP, then you
have nothing to fear. If you are using a <mailto:yourname@...>
yourname@... type email address, it is very important that you NOT
open any emails on the group list with the subject "New Graphic Site".
I am a member of 8 yahoogroups and it has now hit all but 1 of them.

I do not think that UTARC group is immune even though it's not a Yahoo
based group. From what I read, it infects & sends itself to the address
book of those with the Yahoo email account, and therefore is this list
address is in their address book, it could be sent to this list.

Just be forewarned, don't open anything if you do get that email.

From: William McKeehan
Topic: 2045 Message: 2061

Everything in my note should be set from the front panel of the D700
(this was one of the reasons for suggesting these settings). Even the
3-L UIDIGI setting (that's menu 3-L on the D700) is to be set from
the front panel.

In my mind, this is one of the biggest things that is missing from UI-View. It's often important to see where a station has been, not just where they are.

Has no one written a plug-in to address this? Or is there one available?

Well....no.? No luck at the hamfest.? I did get some rather strange looks though for asking about a Hustler antenna.? One dealer won't even carry them and questioned me as to why I'd want a Hustler antenna.? Without any further to do, I will?order the Hustler G6-270R antenna tonight and get it delivered to us right away.?
Moe, how is the digi site coming along?? With the antenna arriving soon and the TNC readily available, it looks like we'll have everything we need to start repeater work soon.?

If you ran a log during the time you wanted to track, do as one suggested, exclude everything but the station you want to see, the set the expire time in miscellaneous setup to to <0>.

I have noticed my posts take several hours to get through.

I have mailing list capability on one of my web sites, http://www.twiar.org. I host 4 mailing lists on that server. However, there is not the capability for uploading files into an album like in Yahoo.

I have not tried Gmail's mailing list. However, if they have the capability for album entries, I would think we could migrate to that list.
